FOR the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., S.F.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1977.—VOLUME LXXVI. Number 22. SAN FRANCISCO, SATURDAY, MAY 28, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

California's Largest Copper Producer.

In recent issues extended notice was made of California's copper mines. The great continuous demand for copper in the electrical world and the present prominence occupied by this metal justify additional remarks regarding all sources of its supply. Since the sale of the Iron Mountain property in Shasta Co., Cal., to an English company three years ago, the progress of development has been such as to make it a factor in the copper supply of the continent. A recent illustrated article in the Redding *Searchlight* by M. E. Dittmar, its editor and proprietor, gives some further statistics and information regarding California's largest copper producer.

IRON MOUNTAIN, CALIFORNIA'S GREATEST COPPER PRODUCER.

COPPER SMELTER AT KESWICK, CAL.

SURFACE ROASTING: BURNING ORE PILES, KESWICK, CAL.

KESWICK, CAL., SMELTERS AND STAFF HEADQUARTERS.

The Iron Mountain deposit is fifteen miles northwest of Redding, in a porphyry formation. The average width of 200 feet carries a little gold and silver, 7½ per cent copper, 45 per cent sulphur, the remainder being principally iron, zinc occurring in small quantities, arsenic and antimony being entirely absent. The mine shaft is 370 feet deep.

At the mine a large air compressor furnishes power for the drills, and a dynamo generates power for motor cars, which carry the ore along the tram to the dump, where it is again loaded into cars and carried to the smelters at Keswick, eleven miles distant, over the Iron Mountain Railroad, which was constructed the same year that the mine was bought, a grade of 2000 feet being overcome in the eleven miles.

The unusual size of the ore body has necessitated a different style of mining from the ordinary. Instead of timbering exclusively, or permitting huge columns of ore to stand in the works, a system of filling in is in vogue. Hard surface rock is taken in the mine to replace the ore taken out, and the great cavities are filled to the roof as the work progresses. The filling in is partially supplemented by timbering.

At the smelters at Keswick the plant at present consists of three water jacket furnaces, with a daily capacity of 600 tons, a reverberatory furnace, with a capacity of about 200 tons, designed to handle chiefly the fine or powdered ore, which is calcined in rotary furnaces built for that purpose. The capacity for handling fine ore has been largely increased by the addition of a Ropp straight line furnace with a capacity of 150 tons per day. This furnace was recently completed by the Parke & Lacy Co. of San Francisco. The plant for roasting fine ores is further augmented by the addition of a third rotary furnace. The erection of a fifth smelting or matte furnace of a new pattern is in contemplation.

The ore that supplies the water jacket furnaces comes from the surface roasters and kilns direct, loaded on cars specially built for this purpose, and a double, high, level track admits the product to the charging floors of the smelters. The two low-level tracks into the smelter yard are used mainly for the bringing of fluxes to the smelter, and a broad gauge railroad is laid for loading the matte product upon cars for shipment to the New Jersey refineries. Another mode of supply is by aerial tramway from one of the roasting stations on the hill. This ropeway supplies both the Ropp furnace with fine ore and charging floor with calcine ore. The Ropp furnace is also supplied with fine ore direct from the cars, as only the coarser ore is calcined at stations and kilns. From the point of discharge of the Ropp furnace the calcined ore is carried in cars to the charging floor of reverberatory smelter, and is fed into the furnace by means of hoppers.

The system of roasting is interesting and requires skill in adaptation to overcome the many obstacles to success. What might successfully calcine ore at other points could be applied only in a general way, and all details must be mastered as the necessities suggest themselves. In this case necessity is indeed the mother of invention. The first system employed was in the nature of a series of kilns. Several tiers of these were constructed in the form of a crescent, on the lower side of the track, with a charging capacity of about 6000 tons. These kilns are constructed of stone with side and end drafts, and a big stack leading up the mountain side carries away the dense fumes and at the same time hastens the calcination of the ore. A charge in these tiers of kiln is roasted in about thirty days.

Ground is cleared and stations established with receiving bunkers, and upon the cleared space high piles of ore built up and ignited. By this system the ore is calcined in about sixty days, but the saving is made in the practicability of extending the roasting capacity any space required without the original outlay of building kilns of masonry, and afterwards keeping them in repair. The present roasting capacity at these surface stations is probably 40,000 tons and to thoroughly calcine the ore sixty days is required, though the ore is seldom allowed the full time. After roasting, the ore is loaded on cars for the smelter, or carried by means of the ropeway.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—Iron Mountain, California's Greatest Copper Producer; Surface Roasting; Burning Ore Piles, Keswick, Cal.; Copper Smelter at Keswick, Cal.; Keswick, Cal., Smelters and and Staff Headquarters, 561. Treating Oxidized and Pyritic Gold Ores; The Battleship Oregon; Mines at Mercur, Utah; Strength of Wire Rope; Rubber from Corn; Lighting the Pyramids of Egypt, 568. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Book Notices; Notices of Recent Patents; List of U. S. Patents for Pacific Coast Inventors; Obituary, 572.

AMONG the 11,000 troops in San Francisco this week are miners from all parts of the coast and Colorado. One company—F—of the Idaho regiment is composed almost wholly of Cœur d'Alene miners.

REDUCTION of expenses at the Comstock is again being advocated and practised. As yet no one has been found bold enough to advocate the reduction of miners' wages from the old bonanza rate, Virginia still being the one $4-camp in existence.

IN the close of an interesting letter of personal experience, on page 566, Chas. Taylor utters a truth that will be affirmed by thousands, viz: that the process should suit the ore, instead of "trying to make an ore fit the process," and that "a misfit manager is extremely liable to install a misfit process."

EVERY Pacific coast State and Territory—except California—is taking active measures to have its mineral resources properly represented at the Omaha Exposition. Southern California is doing some practical work in securing space; San Francisco seems content with having the "Commissioners" appointed therefrom.

NEITHER in San Francisco nor at any other U. S. mint will a private assay be made of ore for any one. The only assay done at a U. S. mint is of gold dust or bullion to determine its fineness and value. The only public concern that interferes or competes with the work of private assayers is the Arizona School of Mines—a policy that is adversely discussed in that Territory.

WHILE many prospectors have temporarily thrown aside their tools, and responding to their country's call have gone to the war, thousands are preparing for an active season's work. The Klondike, the entire Yukon region, Kotzebue sound, Alaska in general, British Columbia and the northwest States, will attract a great many during the next few months. In Washington it is expected the Colville reservation will be thrown open to mineral location by presidental proclamation next week.

IF the proposed "war tax" is levied as outlined, it will bear unequally on mining stocks, should they be taxed at par value. Industrials, railroad and bank stocks often sell for considerably more than their par value; mining stocks, on the contrary, oftentimes sell for one-twentieth of their par value, mining corporations being usually obliged to offer shares at a very low proportional figure to get working capital. If taxed at par, that class of securities would pay from 10 to 30 times as much proportionately as some other stocks.

A Governmental Right.

On the next page appears statistics of the mineral yield of California and Colorado for '97. Exact statistics of this kind are hard to procure, as in a number of cases where producers are asked to furnish the information they flatly refuse, claiming that it is an unwarranted interference with private business. If the information so asked were for private purposes they would be wholly right; as it is entirely a governmental function they are almost wholly wrong. The Government confers great privileges, and, in return, has a right to certain things, among others full and exact information when properly sought. Recognition of this general fact is evinced in the just published report of the Senate Committee on the Twelfth Census, in which it is proposed to establish stringent regulations for the taking of the census of all manufacturing and mechanical establishments, and provide fines and penalties for the refusal of the proper officials to furnish the information demanded by the Government, and for the giving of false answers to the inquiries of official enumerators. It is stated that every official of every corporation and every establishment of productive industry, whether conducted as a corporate body, limited liability company or by private individuals, from which answers to any of the inquiries are required who shall refuse to give true and complete answers, or who shall wilfully give false information, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding $10,000, to which may be added imprisonment for a period not exceeding one year.

This sounds somewhat arbitrary, but emphasizes the point, viz., that if the Government wants to it has the power and can rightly enforce it. While it would be impolitic, unwise and arbitrary for the Government to announce that any gold producer of California refusing to furnish the information demanded by the Government's properly constituted authorities made himself liable to fine and imprisonment, yet the principle is there and could not be successfully combated. Impertinent inquiries and wholesale questioning rightly rouse the fear that the information obtained may possibly be used to the detriment of the answerer, and in the case of federal representatives some of the questions are silly and useless, but exact statistical figures should be promptly and cheerfully furnished to accredited Government representatives for reasons that will readily suggest themselves to any intelligent man.

SEATTLE, WASH., reports regarding the torpedo boat built there for the Government are not encouraging. The published statements do not indicate a compliance with all the test requirements. At the time the Secretary of the Navy awarded contracts for the construction of three torpedo boats, it was thought that the Seattle builders' bid was too low—$148,000. The San Francisco bid was $175,000, not too much when all the requirements were taken into consideration. Experienced ship builders figured that at the first-named price it would be impossible to meet Government requirements.

THIS west half of America produces the coin that is the blood of business, the sinew of war, the backbone of the nation, and also sends men to fight the nation's battles. Camped in San Francisco this week were volunteer soldiers from California, Colorado, Utah, Idaho, Oregon and Washington, and as these lines are being written, the first U. S. troops that ever carried the flag to fight in the eastern hemisphere, among whom are many miners, are passing through the Golden Gate en route to the Philippines.

THERE is little use in railing at the "promoter." The fact that he exists, the true as well as the bogus variety, indicates a reason and a cause. It is just about as hard work and a good deal finer to find a man to buy a mine for a good figure than to find a good mine to sell. The promoter always was, is, and probably always will be, whether called by that name or some other.

Reservations, Timber Cutting, Etc.

In last week's issue it was authoritatively shown that the Yosemite, Cal., reservation is not open for prospecting or mining. Further questions have been received regarding Government forest reserves, the general right to cut timber on the public domain by and for the use of miners, etc., which demands further statement.

In the "Rules and Regulations" issued from the General Land Office and approved by the Secretary of the Interior June 30, 1897, under the subhead "Location and Entry of Mineral Lands," Secs. 19 and 20 say: The law provides that any mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States, and the rules and regulations applying thereto, shall continue to be subject to such location and entry, notwithstanding the reservation. This makes mineral lands in the forest reserves subject to location and entry under the general mining laws in the usual manner.

Owners of valid mining locations, made and held in good faith under the mining laws of the United States and regulations thereunder, are authorized and permitted to fell and remove from such mining claims any timber growing thereon, for actual mining purposes in connection with the particular claim from which the timber is felled or removed.

This last applies to the public domain in general. In the case of mining or prospecting in a forest reserve, the miner or prospector is not confined to the limits of the mining claim, in the use of timber, but may go outside such limits for legitimate requirements. Further specific information on this subject of cutting timber by miners and prospectors on Government forest reserves, may be had upon application to B. F. Allen, Los Angeles, Cal.

In connection with the above is to be noted a continued interpretation of the law which precludes the California miner from enjoying the privileges accorded miners in other parts of the United States. On June 3rd, '78, there were two statutes passed by Congress. One happened to be printed on page 88, the other on page 89, and all judicial interpretation in the past twenty years has ponderously presumed that the one on page 89 shall prevail, to the effect that the timber on the public lands in California is absolutely protected, while in Colorado, Montana, Idaho, North and South Dakota, Wyoming, Nevada, Utah, Arizona, New Mexico and Alaska the cutting of timber is permitted for the use of the miners and others under certain restrictions. Under the act of June 3rd, '78, (page 88) the cutting was permitted only upon mineral land, but the act of March 3rd, '91, extended this privilege to unoccupied, unreserved non-mineral public land. It is believed that proper representation in Congress by our representatives would result in removing this local restriction and place California on the same free footing with her sister commonwealths. It may be stated that the recently appointed U. S. Surveyor General, J. M. Gleaves, is a friend of the mining interests, and that miners who want prompt and authoritative response to the numerous inquiries that constantly arise regarding matters within his province would do well to write him, 610 Commercial street, San Francisco, Cal.

AS INDICATIVE of the activity in the mining world is noticed that at the University of California the senior class in the civil engineering course is this year reduced to almost nothing. A Berkeley report says: The senior class of the college of civil engineering at the University consists of one man, W. C. Pidge '99. When Pidge entered college three years ago he had a number of fellow classmen in the civil engineering college with him, but with the recent mining revival most of them changed their course to mining. The civil engineering department graduated nine men at the last commencement, and the older alumni of the civil engineering college are now looking anxiously toward Pidge to keep the line of C. E.'s from becoming extinct. Some of the world's present foremost miners are graduates of the California University and there is little wonder that in the present stir in mining the ranks of the mining college should be filled at the expense of other departments.

California and Colorado Mineral Yield for 1897.

Statistics are always interesting; when official are worthy of publication, and when approximately correct, are of value. Herewith is published the 1897 yield of California and Colorado, the former being furnished by Statistician Chas. G. Yale, the latter by Colorado's State Commissioner of Mines.

The following is the yield and value of the mineral substances of California for 1897, as per returns received at the State Mining Bureau in answer to inquiries:

Antimony	25 tons.	$ 3,500
Asphalt	22,697 tons.	404,350
Bituminous rock	45,470 tons.	128,173
Borax	8,000 tons.	1,080,000
Cement	18,000 bbls.	66,000
Clay—Brick	97,468 M.	563,240
Pottery	24,592 tons.	30,290
Coal	87,449 tons.	196,255
Copper	13,638,626 lbs.	1,540,666
Gold	767,842 oz.	15,871,401
Granite	339,288 cu. ft.	188,024
Gypsum	2,200 tons.	19,250
Infusorial earth	5 tons.	200
Lead	596,000 lbs.	20,264
Lime	287,800 bbls.	252,000
Limestone	38,796 tons.	38,556
Macadam	487,911 tons.	313,087
Magnesite	1,143 tons.	13,671
Manganese	504 tons.	4,080
Marble	4,102 cu. ft.	7,280
Mineral paint	1,115,280 lbs.	8,165
Mineral waters	1,508,192 gals.	345,863
Natural gas	63,920,000 cu. ft.	62,657
Paving blocks	1,711 M.	35,235
Platinum	150 oz	900
Petroleum	1,911,569 bbls.	1,918,269
Quicksilver	26,648 flasks.	993,445
Rubble	333,212 tons.	287,025
Salt	67,851 tons.	157,530
Sandstone	77,000 cu. ft.	24,086
Serpentine	2,500 cu. ft.	2,500
Silver	754,649 oz.	452,789
Slate	400 squares.	2,800
Soda	5,000 tons.	110,000
Total value		$25,142,441

The aggregate yield in 1896 was $24,291,398, and in 1895 it was $22,844,664.

The relative rank of the counties of the State, in point of mineral production, is given in the following table. In each case the value includes that of all mineral substances combined produced in the respective counties for the year. Some counties produce, in addition to gold and silver, five, six or seven other substances, while other counties, which yield little or no gold or silver, produce in large quantities quicksilver, mineral oils, copper, lead, asphalt, structural materials, etc. The figures after the names of the counties indicate aggregate value of all mineral products for the year, including the precious metals. The term "undistributed" includes total values of such substances as are grouped to avoid disclosing private business, as in the case of a single operation in a county. In the tables published by the State Mining Bureau, from which these figures are taken, the amount and value of each substance in said county is set forth. It is, therefore, necessary in some cases to place the figures in the "undistributed" column.

1.	Shasta	$ 2,224,706
2.	Nevada	1,895,567
3.	Tuolumne	1,811,383
4.	Los Angeles	1,648,574
5.	Placer	1,578,637
6.	Calaveras	1,444,006
7.	Amador	1,368,770
8.	San Bernardino	1,312,780
9.	Trinity	1,107,961
10.	Kern	931,604
11.	Siskiyou	842,157
12.	El Dorado	685,312
13.	Butte	680,010
14.	San Diego	626,568
15.	Mono	598,480
16.	Napa	555,372
17.	Santa Barbara	491,382
18.	Mariposa	452,087
19.	Sierra	370,254
20.	Ventura	368,282
21.	Plumas	339,953
22.	Inyo	339,079
23.	Alameda	303,330
24.	Santa Clara	301,800

In 1897 all the antimony produced in California was from Kern county. Asphaltum was produced in Kern and Santa Barbara counties; bituminous rock in Santa Cruz and San Luis Obispo. Brick clay in quantities was utilized in Alameda, Butte, Kern, Los Angeles, Marin, Sacramento, Santa Clara, San Joaquin, San Francisco and Shasta counties. The cement all came from San Bernardino. Clay for pottery was from Amador, Placer, Riverside, Sacramento and Solano counties. The coal was from Alameda, Amador, Contra Costa and Riverside counties; and the copper from Calaveras, Nevada and Shasta counties. The granite produced was from Madera, Nevada, Placer, Sacramento, San Luis Obispo, Solano and Tulare; gypsum from Los Angeles and San Benito; infusorial earth from Los Angeles; and lead from Inyo and Mono counties. The lime and limestone came from El Dorado, Kern, Mono, Monterey, San Benito, San Bernardino, Santa Cruz, Shasta, Solano and Tulare counties. Macadam was quarried in largest quantities in Alameda, Los Angeles, Marin, Sacramento, San Benito, San Francisco, Solano and Sonoma counties. The magnesite was all from Napa county; manganese from Alameda; marble from Amador and San Luis Obispo. and mineral paint from Calaveras, Sonoma, Riverside and Stanislaus counties. Mineral waters were bottled and sold from Butte, Colusa, Contra Costa, Fresno, Humboldt, Lake, Monterey, Napa, Santa Barbara, San Benito, Santa Clara, San Diego, San Luis Obispo, Sonoma and Tehama counties. The natural gas is mainly from San Joaquin, though a little is utilized in Santa Barbara county. Paving blocks are from Sacramento, Solano and Sonoma. The platinum is from Trinity and Del Norte. Petroleum is from Fresno, Los Angeles, Orange, Santa Barbara, Santa Clara and Ventura counties. Quicksilver was produced in Colusa, Lake, Napa, San Benito, Santa Clara, San Luis Obispo, Sonoma and Trinity counties. Rubble in quantities was quarried in Humboldt, Madera, Placer, San Diego, San Francisco, Sacramento, San Luis Obispo and San Mateo counties. Salt came from Alameda, Colusa, Riverside and San Diego; sandstone from Colusa and Yolo; serpentine from Los Angeles; slate from El Dorado; and soda from Inyo. Many of these substances are found in other counties than those named, but were only mined in 1897 in the counties stated. Only three counties produced as many as seven different mineral substances in 1897, and these were Los Angeles, Sacramento and San Luis Obispo.

As far as the largest production of different substances was concerned, the "banner counties" of 1897 were as follows: Alameda county leads in production of manganese and salt; Amador in marble; Colusa, sandstone; Contra Costa, coal; El Dorado, slate; Humboldt, rubble; Inyo, lead and soda; Kern, antimony; Los Angeles, brick clay, gypsum, infusorial earth, serpentine and petroleum; Napa, magnesite, quicksilver and mineral waters; Nevada, gold; Riverside, pottery clay; Sacramento, granite; San Bernardino, borax and cement; San Francisco, macadam; San Joaquin, natural gas; Santa Barbara, asphaltum; Santa Cruz, bituminous rock, lime and limestone; Shasta, copper and silver; Siskiyou, platinum; Sonoma, mineral paint and paving blocks.

It is to be noted that only one county has had the lead in five things—Los Angeles; two lead in three articles—Napa and Santa Cruz; and five in two—Alameda, Inyo, San Bernardino, Shasta and Sonoma.

Colorado's State Commissioner of Mines, H. A. Lee, furnishes the following as the total production of gold, silver, copper and lead in that State for 1897:

Gold—947,249 ounces	$19,579,636 83
Silver—21,278,202 ounces	12,692,447 47
Copper—9,151,592 pounds	960,917 13
Lead—80,799,778 pounds	2,731,032 49
Total	$35,964,033 92

Scientific and Accurate War Reports.

Referring to the illustrated article in last week's issue on the production of animated pictures, it is further interesting to note the recent remarks of T. A. Edison's agent to the N. Y. *Electrical Review*, showing a new scientific system of "reporting" war news for the papers. He said:

"Newspapers are busily engaged and spending money without stint to get news from the front, and we are quite as busy getting picture reports from the scene of action in connection with the war. By picture reports I mean actual animated pictures of the movements of troops, ships, etc. Our representative will be among the first to land in Cuba. He will be properly accredited, and you may expect the portrayal of some very thrilling scenes by means of the Edison projectoscope.

"When a batch of negatives arrives it means practically the issuance of a war extra by us. The subjects are telegraphed ahead to us here, and the factory works day and night to get the negatives properly developed and rushed to the theaters and other customers. We issue extras properly describing the subjects and keep the printers right at it so as not to lose a moment. Telegrams by the score are rushed to the theaters, and in a marvelously short time the pictures are shown to the audience. The anxiety which awaits the first development of a film at the works is very great, as any one of a dozen accidents might happen, which would ruin the production, and time, labor and money would be thrown away. In the film taken at Havana—the 'Funeral of Nine of the Maine Victims,' which, by the way, is one of the most remarkable ever taken—there are no less than 2500 pictures, each one complete and perfect in itself. The scene must have no breaks in continuity or the result is not satisfactory. These scenes are taken at a rate of about forty pictures per second.

"We have our troubles, however, because we are limited as to the time of day in which to take the pictures. We must have a good light and if battles are to take place at night or in a rainstorm we have to throw up our hands. It seems a large proposition to take a battle, but it can be done, and right in this line let me say that Mr. Edison stated the other day that there should be an animated picture camera on the bridge of every war vessel to take engagements between ships, maneuvers, etc., and thus secure a perfect record of the whole thing. The United States Government has spent hundreds of thousands of dollars in the preparation of the annals of the Civil War. Well, here is a chance for a faithful and more vivid record than is possible in cold type.

"Suppose, for instance, our man who was at Hongkong shortly before the battle of Manila and from whom we have not heard for some time (and naturally suppose he went to Manila with one of the ships) had really taken the great naval battle. Would it be possible to find a scene to reproduce which would so thrill an American's heart?

"We are in the infancy of this great invention of Mr. Edison. It will surely be a most important factor in matters of record in the near future and play a part in mechanical and medical science as well."

Colorado Ore Market.*

Inquiries relative to the methods pursued for the determination of values contained in ores, manner of settlement, prices paid, etc., etc., etc., are of frequent occurrence. These questions in the main emanate from non-residents, who have mining interests in the State and seem to feel that the value fixed upon ore is largely a matter of caprice with the smelters or ore buyers. To correct this erroneous impression, a brief description, general in character, will suffice.

What is known as "ore sampling" or "sampling" is the determination of values in ores placed on the market. This process consists of so mixing the ore that the final portion taken to the assayers is an average of the whole.

The methods pursued for obtaining this homogeneous mixture are largely dependent upon the character of the ore being treated. For illustration, what is known as a "spotted ore" will be traced through. A spotted ore is one having finely disseminated "spots" of high-grade ore scattered through a comparatively barren gangue. Free gold in small "spots" throughout a barren quartz would be called "spotted ore." Ores of this character, after being received and carefully weighed, are passed through a rock breaker or crusher to rolls and so reduced that the whole will pass through a revolving screen, having four openings to a square inch. When thus reduced in size, the ore mass is reduced in bulk, usually one-tenth being separated and piled separately. This reduction or separation is effected in various ways, but generally by an automatic device that takes out one and permits nine-tenths to pass to storage bins. The most simple method and one used almost entirely by some plants upon "spotted ores" is to discharge the crushed ore upon a working floor, from where it is removed as fast as it is discharged, by men with shovels. If a tenth part is being separated, every alternate tenth shovelful is thrown to one side. The same method is applied if a fifth, twentieth, or any desired proportion is wanted. The tenth part, if still considered too large, may be further reduced by the same method. When the decided reduction is made, the ore is still further reduced in various ways, the most common being the use of a "split" shovel, or by "quartering." A split shovel is practically a long, narrow shovel, usually calculated to hold an amount equal to one-fifth to one-tenth of an ordinary shovelful. When a split shovel is used it is held by one man and the ore from the pile is pitched squarely upon it. The amount caught is placed alternately in two piles, one being designated as the original and the other the duplicate sample. If these samples are still too large they are further reduced, and the operation continued until each does not weigh to exceed 100 to 400 pounds, the amount being governed by the quantity of ore being sampled. If the quartering system is used, the segregated one-tenth is first shoveled into a cone, care being taken that each shovelful is poured upon the center and the ore allowed to distribute itself upon all sides of a cone thus raised. When coned the ore is scraped down, commencing at the bottom of the pile and raking same outward, thus forming a large circle of ore 3 to 6 inches deep. Then a marker is taken, usually a wooden straight edge, and slid back and forth across the center of the pile, making a plain mark and dividing the ore into quarters or four equal parts. The two opposite quarters are then wheeled off to the storage bins and the remaining quarters are reconed again and raked down and the pile again reduced in the same manner. As the bulk becomes smaller, the ore is often reconed several times before removing opposite quarters to insure a thorough mixture. When the pile has been reduced sufficient to transfer to sample room proper, it is coned and opposite quarters taken, one being designated as the original and the other the duplicate sample.

In the sample room proper, the ore is passed through finish rolls and crushed so it will all pass through an eight-mesh screen. It is then placed on an iron floor, coned and reconed and reduced further by removing opposite quarters until each sample has only from ten to forty pounds, this amount being largely in accordance with the wish of the owner of the ore. When reduced to this stage the sample is taken to another room and, after drying, passed through a grinding mill that reduces the sample to a fine pulp, or so that it will all pass through a screen, varying from 60 to 200-mesh, this being also governed by the desire of the owner. When passed through this screen the powdered ore is placed on a "blanket," usually a piece of oil cloth, and rolled back and forth until thoroughly mixed. Still further reduction in bulk is made by quartering, spreading and taking small amounts all over the spread-out mass, or by an automatic device that cuts out several sections in the ore when passed over it. The final sample weighs from two to ten ounces. These are usually cut out in triplicate or more, any one of which the owner may choose, the buyer takes one of the others and the remaining samples are filed to await settlement. Both the buyer and seller have their samples assayed and the value per ton determined. If the assay results agree, a settlement for ore is made. If the two sets of assays differ but little, settlement is usually effected by a "split," that is, an average of the two. If the assays differ materially, both buyer and seller have their assays repeated, and should the differences remain the same, the filed sample is introduced and submitted to an assayer mutually agreed upon, who is called an "umpire" and whose results are usually final.

In low-grade sulphide and iron ores, the ore is often reduced in bulk before crushing, only the segregated part being passed through the crushing machinery. After reaching the sample room proper the operation is similar on all ores, regardless of grade.

Up to the time of accepting settlement all ore remains the property of the seller. He is at all times requested to be present and watch the weighing, sampling and taking of moisture sample, and if in any manner dissatisfied, which rarely happens, he may have all the ore again placed on the car and ship same to another plant.

All of the reduction works of the State have well-equipped sampling departments, but those who do not desire to ship to a buyer direct can consign their ores to the public samplers. These plants are conducted on the commission basis and charge from 75 cents to $1.50 per ton for sampling and selling the ore. Their methods of sampling are the same as above described and their samplers are submitted to the various smelters for bids, the public samplers guaranteeing their samples and weights to be accurate.

The oft-repeated charge that reduction plants systematically rob the ore producers is without foundation. Reduction plants, as a rule, represent large investments and their financial success is largely and in most cases wholly dependent upon public patronage. As a strictly business proposition, therefore, they cannot afford to be otherwise than upright in their dealings with customers. Nothing in the work relative to ascertaining the value in ore is hidden, and inspection of same is requested rather than avoided. Settlements are made in accordance with contract, and after settlement the recovery of amount paid for ore is a matter that only interests the ore buyer.

The value of ores is primarily dependent upon the market price of metals upon the day of settlement, New York quotations governing the ore market. Having ascertained by assaying, sampling and weighing, the amount of metals contained in ores, settlements are then adjusted in accordance with contract or character of ore. In cyanide, chlorination and like plants, the ores are limited in character and are paid for upon a "flat" basis, i. e., so much for gold, less a fixed price for treatment. These rates for treatment range from $5 to $10 per ton for ore delivered at works, the price being governed by value.

The ores marketed at smelters cover all known mineral combinations, and the charges for treatment are nearly as variable as the ores treated. For this reason no fixed price for treatment is possible, but each ore is rated in accordance with its gold, silver and lead value and associated minerals. Zinc, for example, is termed refractory, and its presence in considerable quantity adds to the price of treatment. Iron, on the other hand, if it exceeds the silica in percentage, is paid for or reduces the treatment charge. Iron, however, may be in either an oxidized or sulphide form, the latter requiring roasting, the former can be used raw, and the two kinds of iron are, therefore, subject to different schedule prices. The various combinations, with differences as in iron, could be extended indefinitely, and iron is quoted for the purpose of showing that the smelter charge must be made to fit the ore and no fixed schedule can be stated.

In a general way ores are divided into classes known as lead, sulphide and silicious. Gold is paid for at rate varying from $19 to $20 per ounce; silver at rate of 95 per cent of New York quotation, and lead in accordance with percentage calculated on market quotations. The charges on lead ores vary from $10 per ton to free treatment; sulphide ores from $12 to $1.50 per ton, and the silicious ores from $5 to $12 per ton.

* Report of State Mine Commissioner.

An Unusual Mineral.

Krennerite, a mineral not previously identified from this country, has been found in the Independence mine at Cripple Creek. It occurs in brilliant crystals of a pale yellowish bronze color, but tin-white on cleavage faces. Eliminating the insoluble matter, an analysis shows the mineral to contain 43.86% gold, 0.46% silver, and 55.86% tellurium. The crystals are small and about as broad as long, and the prismatic faces are striated. They have a perfect basal cleavage, which is a prominent feature of the mineral. The lack of any appreciable quantity of silver in the Cripple Creek ores, as shown by the returns of the smelters, is proof that much if not nearly all of the mineral passing as sylvanite is either krennerite or its sub-species, calaverite. Krennerite ranges from silver-white to brass-yellow in color, and is so near sylvanite in its physical properties that frequently the eye cannot distinguish one from the other.—Georgetown, Colorado, Courier.

Some Metallurgical Methods.*

NUMBER II.

The blowing in operation, or starting of one of the blast furnaces, requires experience and a sharp eye kept on all that is going on. Following is described as the operation of starting a lead blast furnace. From two to four days before the real start is made a drying or warming fire is lighted in the brick crucible. The water pump is started and water turned on to all the cast-iron and wrought-iron steel jackets, tuyeres and separator breasts. Usually there is a separator at both ends of a large furnace, and when the fire is lighted one of these separators, breast and slag spout is taken out of the furnace to leave an opening, through which the wood is passed into the crucible. As soon as the bricks of the crucible begin to warm up, the engine driving the blower is started (or in a nest of furnaces the blast is let into the bustle pipe from the main blast or air pipe), and the fire urged, by the wind thus forced, into the furnace. Care is taken that a plentiful supply of water is kept in all the parts of the furnace, that would otherwise get heated. The fifteen tons of lead requisite to fill the crucible is now melted in, with the aid of the wood fire (urged by the blast from the blower), in lots of twenty-five to fifty bars at a time. This usually takes eight or twelve hours, and it is not advisable, though possible, to take less time, inasmuch as the lead would not retain sufficient heat to keep it molten for the few hours required, after the furnace is closed up or started, before the furnace begins itself to produce lead from the ore. Immediately all the bars of lead are thoroughly melted in, the whole of the hot ashes and coals from the wood are then skimmed off the lead, leaving it almost clean. Too much time must not be wasted over this operation, for the molten lead in the crucible is cooling while exposed to the air. It is also necessary to get these ashes out, because, if left in the furnace, they form a crust over the well or crucible, which acts as a shield, and prevents the lead reduced in the smelting operation from getting into the crucible, so allowing the lead of the well to chill from want of fresh supplies of heated lead, most probably causing a shut down of the furnaces. As soon as the ashes are all out, some easily ignited wood is thrown on the face of the molten lead, which last should be just hot enough to ignite the chips in a few moments. The corners of the furnace are well supplied also to make sure of a good fire all over the crucible. The heavier wood is then thrown in, and the mason then puts back the separator, breast and slag spout, having all necessary bricks cut the exact size required beforehand, so that the least possible time may be consumed from this time on until the blast is put on the furnace. Immediately the mason has secured the separator and its parts in place, more wood is dropped into the furnace from the top floor through the feed opening until the tuyeres are just covered with wood. If the flames have not obtained a good hold of the wood one must wait a little. As soon as satisfied that the fire has a good enough hold on the wood, some 1600 pounds of coke is emptied into the furnace out of bags which have all been weighed up in readiness. Then the following charges are shoveled into the furnace as rapidly as the eight or nine men on the furnace can do it. The first fifty of the charges given below are weighed up and stacked on the floor around the feed opening of the furnace, each charge being divided off from the next with a piece of wood. This weighing up is done to facilitate the filling up of the furnace when every moment is precious.

The following are the figures for twenty-five blowing in charges: Slag, 750 pounds; manganic ironstone, 75; limestone, 75; total, 900 pounds, not including coke in all cases; coke, 125 pounds. Twenty-five charges of slag, 500 pounds; carb. lead ore, 275; limestone, 75; manganic iron, 75; total, 925 pounds; coke, 125 pounds. Fifty charges of lead ore (carbonate), 325 pounds; slicious iron, 150; manganic iron, 75; limestone, 200; slag, 250; total, 950 pounds; coke, 125 pounds; then regular charges, 1000 pounds.

After the first fifteen charges have been put in ten bars of lead are dropped into the furnace; after the next fifteen charges ten bars more; after the next twenty-five charges come ten bars of lead, and for say fifty charges afterwards one bar of lead is fed in with each charge. This is done to get a lot of lead into the crucible quickly, for this additional lead, being heated to bright redness in its descent in the furnace, accordingly raises the temperature of the lead in the well or crucible, and stops the risk of the lead's freezing up which we first melted in. While the men are filling up the furnace see that the tuyeres are all closed on the furnace, so that no gases from the wood can get into the main blast pipe and cause damage by exploding; that all the jackets are kept cool, and the syphon from the lead well to the outside of the furnace is not choked up, and has a bright fire in it. With the wook and coke which were first put in forty of the blowing-in charges fill the furnace to within 6 feet of the feed floor; then, sending all the slag men down to the proper stations, the blast is turned on at a pressure of about three ounces to four ounces to the square inch. In a very few minutes every joint between the water

Condensed.

jackets is smoking if they have not been well rammed with fire clay. Wet clay is placed on the smoky places to check it, because, after a while, these streams of smoke catch fire and sometimes burn the wind bags. About twenty minutes after the blast has been turned on the smoke all ceases through the furnace beginning to smelt the charges which have just been put in, the first slag formed chilling on the jackets and closing the cracks. Then the tuyeres are examined frequently to judge how the slag is forming. In an hour and a quarter to one and a half hours after the blast goes on the first slag can be tapped from the furnace. The slags first produced by the furnace are purposely made lower in silica than those produced when in regular work, for, being low in silica, the newly blown-in furnace will be able to melt them easily and quickly, and so get a good start. As a rule, the first slag contains about 30 per cent of silica. When the last of the blowing-in charges are in the furnace the regular charge is put on. The following charges with slags from same, together with the dip sample assays and mattes made, will give some idea of the usual composition of the smelting charges when in regular work. The last eight are selected because sulphide of lead was used in large quantities, and no carbonate of lead ore :

SAMPLES OF CHARGES ON FURNACES IN POUNDS.
NO. 1 TO 8.

The ironstone shown in these tables is distinct from the iron ore, the latter being the produce of the mine, analyses of which are given under the head of manganic iron ore, whilst the former was purchased at a cost of about twenty-one shillings a ton. It assayed from 6 to 14 per cent silica and 50 to 60 per cent of Fe. The limestone came from Terrawingee, and assayed from 6 to 11 per cent silica, 1 to 5 per cent of carbonate of magnesia, 1½ per cent ferric oxide iron, the balance being carbonate of lime. It cost fourteen shillings a ton landed on the mine.

Regarded as a smelting ore, the Proprietary ore was satisfactory. Its composition, no matter what part of the mine the ore came from, was such a blending of bases and silica that it smelted very easily, and had some means been provided by which the ore could have been regulated in its fluxing value as it went to the furnaces, as well as its silver and lead value, the mischief caused by irregular qualities of ore would have ceased, and allowed of clean smelting there as elsewhere. The presence of manganese binoxide in the ore was also of assistance, both as an oxidizer for the sulphur, and for its rapid melting qualities. The zinc was never present in the slags in sufficient quantity to cause any mischief. Alumina was the greatest nuisance, and Mr. Blakemore's experience has been that with slags up to about 36 per cent in silica the alumina acted as a base, but usually, as soon as this point was overstepped, the slags immediately thickened up and assumed a most silicious appearance, due, in his opinion, to the alumina changing its functions from that of a base to an acid.

After a furnace has been at work for a day or two all trouble arising from the blowing-in operation is gone, if care has been exercised. The blowing-in crust is some trouble if allowed to form, but as a rule it is great want of attention that allows this to make. It is due to the ashes of the wood, which was thrown in at first to ignite the coke, forming into a solid mass through the first slag formed chilling in it. The mischief of it is that it prevents the lead reduced or added to the blowing-in charge from getting into the well, and unless holes can be driven through it into the lead underneath the latter will chill, and cause trouble, worry, and expense. When the furnace has been running slag for about an hour, the inside can be broken up by introducing an inch-round bar through either tap hole, and running it well into the furnace in all directions with the aid of seven or eight men. The ashes then float out with the slag, and if this is done fairly often for the first hour or two, all danger of a blowing-in crust is avoided. The blast pressure is gradually risen to the point settled on, ten to fifteen ounces usually, and the temperature of the lead in the well soon increases, until, at the end of twenty-four hours, it is usually bright red. With good ore and plenty of water, free from lime or magnesia, the furnace should have a long and successful run.

The largest output of lead that he knows of from one furnace for twenty-four hours was twenty-six tons, 166 tons of charge being smelted to produce this. The ore smelted consisted of carbonate of lead, averaging about 35 to 45 per cent, and was, of course, the easiest smelting ore to be had. This happened at the British mine when he had charge of the furnaces. The week's output of lead at the same time was 167 tons. Carbonate lead ore is no longer found in any large quantities, and it is now carefully hoarded, so that if a furnace produces from five to seven tons of lead a day it is equal to the average output.

Speed Government in Water-Power Plants.*

NUMBER III.

MARK A. REPLOGLE.

Plate III will serve to make clear the effects of power storage in the government of a water power unit.

In Fig. 1 let *a* represent the power supply, *b* the water wheel gate, *w* the wheel, *c* the turbine power, *d* the power storage, *e* the means of changing the load, and *f* the dynamos' power. It will be noticed that full 750 H. P. can be dropped off instantly by closing

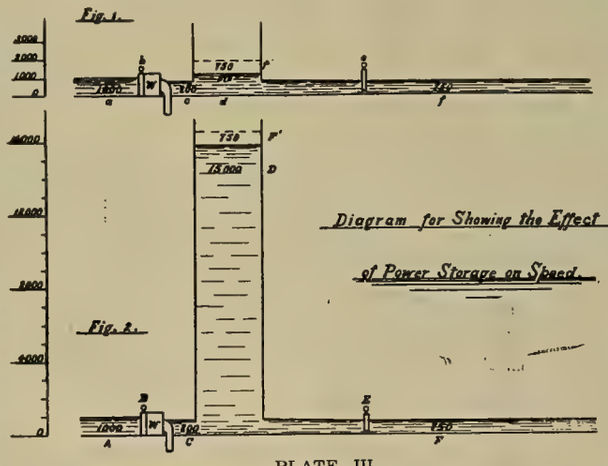

PLATE III.

means *e*. The governor must operate at *b*, and it is cent, hence will theoretically increase the speed of power unit about 2½ per cent by the end of the first safe to say that it cannot be in active operation before one second has elapsed. Note the condition at the end of the first second after the 750 H. P. was dropped. When *e* was closed there was only one outlet for the power generated at *w*, and that was to increase stored energy *d* to dotted line *f'* during the second. This increase will theoretically raise the speed of the whole plant 100 per cent. If it were not for some other principles that step in, this would be the actual speed at the end of the first second. In like manner, if the plant was running empty at normal speed, and 750 H. P. of load were added instantly, the plant would theoretically be standing still at the middle of the first second. Here also other principles step in and change the result somewhat.

In Fig. 2 let *A* be the power supply, *B* the water wheel gate, *W* the wheel, *C* the turbine power, *D* the power storage, *E* the means of changing the load, and *F* the dynamos' power. Please note that all the conditions are the same, except that there is 15,000 H. P. of stored energy in Fig. 2, while there is only 375 H. P. in Fig. 1.

If *E* is closed 750 H. P. will be dropped off, and finds a place at *F'*, increasing the volume of *D* 5 per second. This is also lessened somewhat by the same principles that affect Fig. 1.

It can readily be seen that here is a means of preventing extreme changes in speed until gravity can perform its part of the work. Note the conditions in Fig. 2 if running at speed and a load of 750 H. P. were added.

If the load were suddenly added it must be carried from the reserve power at *D*, using 5 per cent of it during the first second, hence reducing the speed about 2½ per cent theoretically. It can readily be seen that the speed will continue to drop until balanced by new power generated at *W* after the governor has opened gate *B*. It can now easily be seen that *D* in any power plant can be increased until full change in load can be made with very narrow fluctuations in speed. In other words, every foot pound of power or change in load can be intelligently provided for in the construction of a power plant, and variations in speed can be calculated for any change in load if the other conditions are known.

TABLE I.

POWER STORAGE OF SOME WELL-KNOWN PLANTS.

Name.	Units of H. P.	Power Storage Capacity in H. P. for 1 Sec.	Ratio of Power to P. S.
Niagara Falls P. Co	5,000	50,000	1 to 10
Sacramento L. & P. Co	1,000	8,000	1 to 8
San Joaquin E. Co	450	9,000	1 to 20
Portland G. E. Co	600	3,000	1 to 5
Niagara Falls Paper Co	1,200	400	1 to ⅓

Table I will serve to give an idea how the power units of plants differ in the ratio of their power to their power storage. It is safe to say that if the other conditions were equal the possible government in their speeds would show equally as great a difference. Space forbids any further comment, except that each plant is desirous of good government.

TABLE II.

APPROXIMATE LENGTH OF FEED PIPES IN EXISTING PLANTS.

	Head, Feet.	Pipe, Feet.
Ithaca	94	600
Great Falls	40	400
Spokane	60	600
Brantford	30	210
Fresno	1,410	3,800
Niagara Falls	145	200

Ithaca pipe contains 737,500 $MV^2 = 11,800,000 =$ 338 H. P. of kinetic energy in the pipe.

Table II is intended to show the horizontal lengths of feeder pipes of some of the existing electric water power plants.

It is unnecessary to go into the details of the calculations, but the purpose is to show the possible effects of momentum if the water flow was stopped as quickly as an electric load is sometimes dropped. Taking the first in the list, that of the Ithaca Street Railway Co., it is found that the pipe holds 737,500 pounds of water. Assuming that this column has a maximum velocity of 4 feet per second at full load, there will be a pressure of 11,800,000 pounds, or over 4000 pounds per square inch at the water wheel end of the pipe if the gates were closed as quickly as the load is dropped off. Since the static pressure is less than fifty pounds per square inch, and only a reasonable factor of safety provided, it is evident that a serious wreck would be the result of such a quick closing of gates. Yet such is necessary, theoretically, if even speed is desired.

It is also noticed that there is in this pipe before closing the gates 338 H. P. of kinetic energy for one second. Some disposition must be made of this energy, as it is necessary that the column of water be at rest when the wheel gates are closed. The only available disposition of it is to allow it to lo join the power set free when the ad is dropped off, increasing its effect a like amount until the wheel gates can be safely closed.

It can now readily be seen that it is not only necessary to provide power storage capacity enough in a power unit for the changes of load, but also an additional capacity for that contained in the pipes or flumes. This extra power must be provided on opening the gates before the wheel will furnish new power, and must be disposed of before the wheel will stop furnishing power when the gates are being closed. In other words, if the power unit in question is 900 H. P., and calculations were being made to provide power storage so as to allow a full change of load to be made, keeping the speed inside of a given per cent, the calculations must be based on 900 H. P. plus 338 H. P., or 1238 H. P. change at the wheel gates. This makes it clear that closed pipes should be avoided as much as possible, if the government is to be done by changing the flow of water. If it is desired to govern by deflecting the stream in some manner, the only detrimental effect of the long pipe is the power lost or gained by the varying friction in changes of load.

*Journal of the Franklin Institute.

Mine Management and Mismanagement.

TO THE EDITOR:—Having lately read several articles in your paper, and in other journals devoted to mining, in regard to the management, or rather the mismanagement of mines and reduction works, I think perhaps my experience in this section may be of some benefit to your readers.

Some twelve years ago I was sent for to take charge of a large concentrating mill in Santa Barbara, Chihuahua, Mexico. The manager stated that the ore ran 5 per cent lead, 15 ounces silver, average. The mill not being completed when I arrived, I went up to the mine where there was an assay outfit. I stayed there ten days, sampled the ores on the dumps and 1500 cars as they were run out of the mines. Result, ½ per cent lead, 3 ounces silver. On the eleventh day I took the stage for the railroad. The mill was started up; the result I leave to the imagination.

Some ten years ago I was sent for to start up a big concentrating mill, I will not say where, as I am now getting too close to home to enter into particulars. I found a steam stamp of 200 tons capacity, hydraulic sizers, forty jigs, sand grinders for the jig tailings, and twelve Frue vanners. I found the water for the sizers came from a little stand pipe which supplied water for everything else in the mill. I found the ore a copper glance, or sulphide. One blow of that stamp would reduce a piece of the metal to such a fineness that 80 per cent of it would pass a 100-mesh screen. The next day I went to the "mines," twelve miles by a narrow gauge railroad. I found many thousand feet of work. I found perhaps 100 tons of ore on the various dumps; and with a liberal estimate, 100 tons more in sight. I took the train for home the next day. The mill started up and ran for twelve hours. There is no mill or railroad there now.

Some nine years ago I found a sample of ore in the express office, sent me by a responsible firm operating in Sonora, Mexico, asking my advice in regard to the proper way to work ores of that character. I recommended concentration and shipment of the product to a smelter; and specified what I considered the proper machinery for the purpose. I was asked to buy and install the plant, which I did, and in sixteen days run used up every pound of ore they had, or ever have had.

Six years ago, more or less, I was asked to sample a mine, and advise in regard to machinery to work same. I did so, and advised five stamps, plate and vanners. The owner stated that his capital was too small and wanted something cheaper installed. I then advised some kind of centrifugal crusher, and a Huntington mill. These were bought and put in place. I started up the mill, with the result of 52 per cent of values in gold bullion, and concentrates $261 per ton, $1.20 tailings. About a year afterwards I received a letter from the owner, stating that his ore had fallen off in value, that they saved nothing except on the plates, that the vanners were a failure, and to come down at once. I did so, and found the mill run entirely by Mexican labor, except the amalgamator. I found the vanners transformed into bumping tables, and they bumped seven different ways at once. The head pulley bushed down, and the two head roller bearings cut down into the frame so that the field was level, or inclined the wrong way, and the edges torn off the belts. New belts were ordered and put in position, men were found who knew the difference between a vanner and a rawhide, and the mill is running yet; and a letter from the owner informs me that he will increase the capacity of the mill shortly.

About five years ago, more or less, I was sent to sample a mine in Sonora. I found a continuous streak of about 7 inches of iron pyrites and gangue, running $30 per ton in gold; concentrates gave $210 and $225 per ton, and so reported. Three years or so ago, I was requested to go down and start the mill. I found centrifugal crusher, coarse and fine rolls, eight jigs, a 5-foot Huntington mill to crush jig tailings, three hydraulic sizers, and three vanners. I found one revolving screen short. I put in a home-made bump screen in place of short screen. I found water for sizers taken from small stand pipe, which supplied balance of mill, from which boiler feed pump when running would reduce pressure one-half. I built extra tank for sizers, cut off one sizer, and started up on $7.50 ore, costing $2 per ton to haul from mine to mill, with a general manager at $500 per month, secretary $300 per month, superintendent of mine $300 per month, superintendent of mill $300 per month, book-keeper $200 per month, foreman of mill and of mine in proportion, dinner every Sunday, with champagne, all costing not less than $5 per plate. I remonstrated with manager in regard to the value of the ore sent to the mill; was told that it was a stock proposition, and that it was necessary that the mill be kept running, if on waste. My advice was asked as to cyanide method of working concentrates on the ground. I advised against it, as the concentrates carried from 3 per cent to 5 per cent copper. I advised dead roast and barrel chlorination process with chloride of lime and sulphuric acid instead. I received my check and left for home. Since then the cyanide process has been installed; the mine and the mill are now shut down, and a property that would pay from $2500 to $3000 per month, is now lying idle.

Four years or so ago I was offered the superintendency of a mine, operated by English capital, near Bacoachi, Sonora, Mexico. A 10-stamp mill was ready to be shipped from Chicago and the money to pay for same was deposited in a Chicago bank, awaiting a telegram from the general manager, to be paid when the mill would be shipped. Samples of the ore submitted to me gave 1000 ounces and upwards in silver—very much upwards, too, and entirely unsuited to the mill contemplated. I advised the manager to withhold the telegram until we had seen the mine. I found a streak of ore averaging 2000 ounces per ton, from ½ inch to 4 inches in width. I advised careful extraction methods, sorting, etc., and shipment of product to smelter. The result of two years' work on those lines: $30,000 profit to the company, mine abandoned, and at least $20,000 saved by not erecting the mill.

Some two years ago I was sent for to sample a silver mine, and to advise in regard to method of working the ore. I found the finest little silver mine to be found anywhere, thoroughly developed and opened up to a depth of 400 feet. The mine was opened up by three tunnels, driven on the ledge; three ore chutes from the surface to the bottom, running from 500 ounces to 5000 ounces per ton; and between the ore chutes what in any other mine would be waste is ore of an average value of fifty-one ounces per ton. Average width of ore, 10 inches. I advised shipment of rich ore to furnace, as has been and is being done, and roasting and chlorination, and either amalgamation or leaching of the furnace product, as the owner saw fit. The owner went to buy the necessary machinery and fell into the hands of, we will say, Phillistines, who induced him to put up a 10-stamp, wet-crushing mill, with tanks, pans and settlers. Started mill with designer and constructor in charge. Result: less than 1 per cent saved. I was asked to go over and see what could be done. I went, and could only reiterate my former recommendation; and, as he now had stamps, pans and settlers, the installation of a furnace was all that was necessary. I was told that he, the owner, had already spent so much money without any return that he did not feel able to spend the $10,000 or $12,000 required for the installation of the furnace, which I considered necessary, and asked if I could not concentrate the ore. After making the tests I informed him that if he was willing to lose 25 per cent of the values I could guarantee the balance of 75 per cent. I was sent to San Francisco to buy the necessary machinery, installed the same, and the mine is running yet on fillings of old stopes, and saving 77 per cent, as per letter from owner.

On the 22nd of February last, while in Altar, Sonora, on business connected with my vocation, I was approached by the manager of a property owned and operated by foreign capital and invited to go out and see their plant in operation. I welcomed the chance to kill a few days' time and went out with the gentleman. I found a fine concentrating plant, and fine ore to concentrate. I found the mill run entirely by Mexican labor, and among the machinery a lot of vanners; and whenever a belt would run to one side, and, as they never had been adjusted, that was often, a dozen or so Mexicans would grab the opposite side, and, by main strength, pull it straight. I was assured by the manager that the results were satisfactory, and I was transported to Altar, and we parted with expressions of mutual esteem.

A very short time ago I had some ore sent to me for advice in regard to the proper method of working it. I recommended concentration. The ore was of such a character that any kind of fine concentration would answer, and revolving buddles were decided upon because of their capacity and cheapness. They were installed and would not do the work. I was notified, went down and investigated, and had the skeleton corrugated iron covered with Portland cement, as the maker intended, and furnished for the purpose, and the result is all that could be desired.

In view of the foregoing experience, I would ask: "Why is it that the ordinary hard-headed business man in other lines seems to lose all his business acumen and common sense when he goes to mining?" If he was starting a tanyard he would put a practical tanner in charge; or a sawmill, a sawyer in charge; but, when he tackles mining, any old, or young, thing will do for manager.

Mining is just as legitimate a business as any other, and, in point of fact, the profits are surer than in any other, if the manager knows enough to drop a mine when it is no good. The trouble is, a manager will generally keep on sinking, drifting and crosscutting long after the humblest man in the mine knows it has played out, hoping to demonstrate his capability by a new strike.

My experience has taught me that in the majority of cases failures in mining and milling are caused by trying to make an ore fit a process, instead of, in the first instance, installing a process to suit the ore; and that a misfit manager is extremely liable to install a misfit process. CHAS. TAYLOR.

Nogales, Arizona, May 15th, '98.

The Mining Engineer.

TO THE EDITOR:—Is mining engineering a trade, or is it to be dignified by the title of a profession? That is a question which American mining engineers should answer at once, and emphatically. By American mining engineers I refer to those men who have spent time, money and labor for a degree from a reputable college. Such a man, by his conduct, has indicated an ambitious desire to obtain for himself scientific standing. If any man of ordinary intelligence and opportunity, after having passed through the stages of shift boss, underground foreman and finally manager of a small mine, is to be allowed to assume the degree of mining engineer, then it is no longer a degree, the profession becomes a trade and the degree a name. A trade represents manual skill and dexterity, while a profession implies knowledge. I say implies, for it does not follow that the mere possession of a college degree is proof positive of a knowledge of the profession; but it should indicate the completion of a thorough and systematic knowledge of the theory of the profession. A degree should represent scholarly attainment, and success should signify practical knowledge also, for success is properly applied theory.

The mining fields of all the world possess two kinds of mining engineers: 1st. The mining engineer who has both the scholarly and practical education in his profession. 2nd. The so-called "practical M. E."

Of the first suffice it to say he soon proves his worth and is found at the top of his profession. He rarely signs his name with a degree attached, excepting in the case of a scientific paper, where a proper appreciation of a degree is to be expected. The second class are personifications of a paradox, for they claim to have derived their dexterity and manual skill from practice alone, yet they assume the degree of M. E., which should indicate theoretical training as well, and then they spend the greater portion of their time railing against the scientific miner. It is true that either theory or practice is a poor thing alone. We have all met the college "expert" in the mines and heard him dilate in extenso on the rare mineralization of a piece of gouge. He is to be pitied, for he lacks the essential that he cannot assume, and for want of practical knowledge he soon finds he must start on half wages driving a drill or forever give up his bright ambitions in the line of mining.

Now, take the case of the "practical" miner. Have we not seen him in the office of consulting engineer, where he is equally to be pitied with the poor college theorist, whom he often scoffs? Have we not condoned his sorry attempts at a Cam course? Have we not seen him put lime in his mortar boxes "because somebody else did" and "because it gave a higher extraction," when the same result might be arrived at by greasing his guides less? It must be admitted the "practical" miner is as hopelessly deficient as the object of his derision—the college theorist. There is no room for either in the field of mining engineer, and by "mining engineer" I mean true M. E., or consulting engineer, which does not mean simply a surveyor or sampler. The theorist makes a good draughtsman, ordinary surveyor or assayer. The "practical" man makes a good manager under a consulting engineer, and, if he properly understood the position, the consulting engineer is required to fill, he would not be so presumptious as to assume the degree. I say he does not understand the position, for he is told to put a certain timber in a gallows-frame. He knew before that the timber was necessary, and could have ordered it and put it into place without the advice of the engineer—so the situation appears to him—but he has not seen the calculation of the stress on that timber with a certain amount of ore in the bins. He is totally obvious of all this theory, and assumes the title of "M. E." because he can do what he thinks the genuine mining engineer has done when he has misjudged the responsibility of the real engineer.

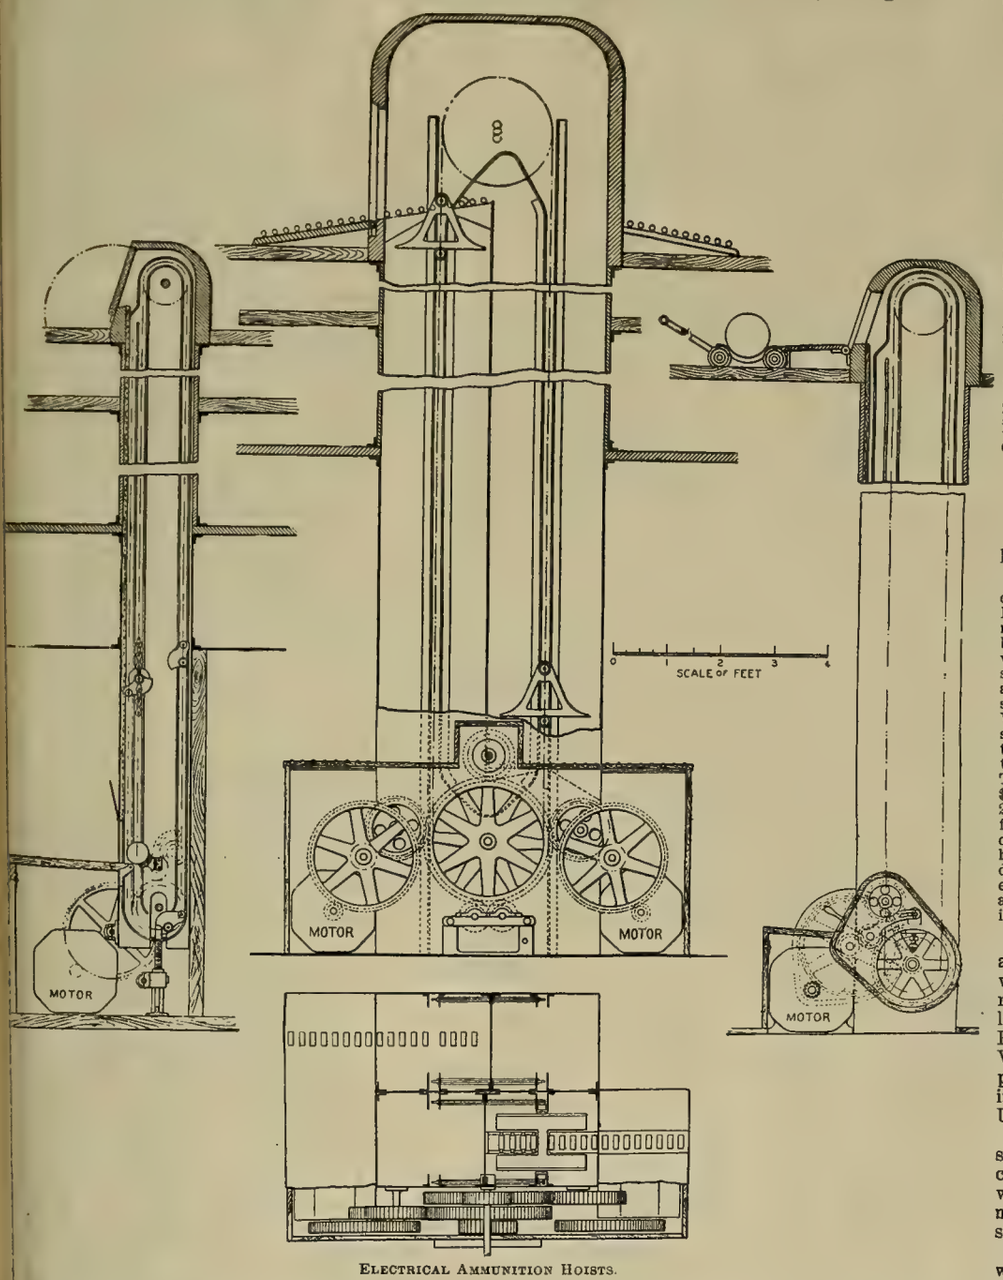
The American engineer does not see the seriousness of this misrepresentation until he goes into a foreign mining field. There he sees that he has worked for years in college and then gone out into practical mining and worked underground as a laborer, then written scientific papers in order that he may have conferred upon him a degree which is an object of derision. He sees a mine abandoned because of bad management, and on inquiring the reason is told that they must have had a "mining engineer" for manager. So it has become a fact that real mining engineers are rarely known as such on foreign mining fields because, as before stated, they rarely sign the degree after their names excepting in the case of scientific papers. The men who bring odium on the degree are the self-styled engineers, who are not engineers at all. It is another case of the thief calling himself a preacher.

The real American mining engineer is known in foreign fields as the "Yankee expert." His ability is at the highest premium, he is all that a mining engineer should be, he has scholarly attainment, he has practical ingenuity, business sagacity and is a skillful manager, but he has to distinguish himself from those who represent themselves to be what

they never can be; he is a "Yankee expert" and not a "mining engineer."

Such are the facts, and the need for a remedy is obvious. How? is the question. There is only one answer: For the legitimate mining engineer to lose no opportunity to brand the impostors, and to organize with this end in view if no other method succeeds. The necessity is great, for the American mining engineer must maintain the prestige which he has won in foreign fields in the face of nameless difficulties and unspeakable hardships.

G. B. WILSON.



Coolgardie, West Australia, March 24th, '98.

Electrical Equipment of War Vessels.

Coupled with the name of Dewey, probably no names have been for the past month in more frequent use than those of the vessels built in San Francisco by the Union Iron Works—the Olympia and the Oregon. Like the San Francisco, the Charleston and the Monterey, they are provided with electrical equipment which greatly adds to their efficiency. Power transmission on war vessels is a prest prominent factor in their mechanical equipment, d the present conflict offers fair opportunity for a ucial test.

Electricity enters prominently into present naval uipment, as do steam and compressed air, the mer being the favorite with most naval officers d constructors. Referring to the electrical de- es on the vessels named above, it is also to be ted that other nations are no less alert to the up- date achievements of science. Herewith are illus- ated electrically operated ammunition hoists aced by Geo. W. Dickie, of the Union Iron Works, the Japanese cruiser Chitose, the electrical sys- n of which is on the two-wire plan, operated at hty volts. There are ordinary service circuits d battle circuits, the latter being run under the otected deck. All wires are covered with extra avy rubber insulation, protected by braid soaked in waterproof compound. Through boiler and engine compartments the wires are in iron armored conduits; elsewhere, except the running light circuits and those running up masts, the wire is in wood moulding. All of these hoists are of the continuous running, endless-chain type, delivering on the gun deck through armored hoods, as shown in the illustration. The traveling carriages are suspended on flat link chains, working over sprocket wheels. The carriages are guided on each side by rollers working in guide rails.

The hoists are fitted, if necessary, to discharge on the deck below the regular discharge, this arrangement being indicated on the drawing. The object of this provision is to be able to serve the guns through ammunition scuttles by hand from below at close quarters, when the upper decks might be swept by the fire of machine guns. Current for the hoists is taken from either of two mains—one for the forward hoists and one for the after hoists, leading from the dynamo-room through iron armored conduits. These two main feeders will be connected to the main switchboard in such a manner as to be supplied by either dynamo singly or from dynamos operating on lighting circuits. Each 8-inch hoist is capable of delivering three rounds per minute to its respective gun. A round consists of one shell and two powder tanks, each being handled separately. The interior of the hood is fitted with a drum mounted on the sprocket-wheel shaft, as shown, having a recess to receive the charges and so arranged as to close the opening except at the instant of discharging or receiving a charge, an important and necessary function, as the principal danger of derangement to this kind of ammunition hoist, is from splinters and debris getting into the hoist casing and wrecking the moving points. All doors in the armored hoods are water-tight when closed, and are arranged to act when open as discharge or feeding tables for the ammunition. The introduction into modern ships of war of quick-firing ordnance up to 8 inches has made the serving of ammunition one of the many difficult problems that confronted the naval architect and the engineer. It also gives an idea of how long a naval engagement will last between modern ships, if they have a chance to do their best, to consider that a ship equipped as the Chitose will be can fire all the ammunition she can carry in two hours.

ELECTRICAL AMMUNITION HOISTS.

Supreme Court Decisions.

At Washington, D. C., this week three cases of some general interest to miners have received final adjudication. They settle the question of the right of the owners of a mineral vein to follow the vein outside of the territory covered by the surface area of location. The first case was the Del Monte Mining Co. vs. the Last Chance Mining Co., the property involved being located in the Sunnyside district in Mineral Co., Colo. The decision was not upon the merits of the case, but in response to questions certified to the court from the United States Circuit Court of Appeals of the eighth circuit, where the case is now pending. There were five of these questions, but only three of them were answered.

The first of these questions was: "May any of the lines of a junior location be laid within, upon or across the surface of a valid senior location for the purpose of defining or securing to such junior location underground or extra lateral rights not in conflict with any rights of the senior location?" This question was answered in the affirmative.

"If the apex of a vein crosses one end line and one side line of a lode mining claim as located thereupon, can the locator of such a vein follow up its dip beyond the vertical side lines of his location?" This was also answered affirmatively.

A question which was answered in the negative related to the side line of another claim, the New York.

Another mining case was that of W. A. Clark vs. William Fitzgerald and others, covering Montana mines, involving the same question as was presented in the second question as given above. The opinion of the Montana Supreme Court was affirmed.

Of Evident Interest.

In the issue of Aug. 29th, '96, appeared the following:

An improved bit to be used with an ordinary well-boring outfit for sampling gravel mines, which was made by E. H. Benjamin of this city, has done considerable to bring that method of examining gravel into favor. Instead of the usual bit used, which dragged and scraped, Mr. Benjamin made his with a longer point, thrown forward, so that it would cut instead of scrape. The bit takes on the shape of a plowshare, and the gravel may be brought up in large quantities for sampling. About this is fastened a "barrel" of sheet iron. Whenever hard rock was struck an ordinary churn drill was substituted. Mr. Benjamin states that in sinking holes on the Old River mine in Placer county, to locate the channel, two-fifths of a cubic yard would be brought up each time. The total cost of the well-boring outfit need not exceed about $200. While with the bit generally used in well-boring but 25 feet per day could be dug, with this it is claimed that 70 feet of holes may be sunk without any extra labor. The value of this method in locating channels or sampling gravel to be hydraulicked will be apparent to miners. The old method of digging shafts or running tunnels or drifts was not only very expensive, but at best could give no ideas of values over large areas. On the Old River mine 120 holes were sunk in locating the channel at an expense of not over $600.

It was rightly judged that the importance of such a device would be speedily recognized, but the editor was hardly prepared for the flood of inquiries and requests for further information that came from, literally, "everywhere." From St. Petersburg, Bombay, London, Luzon, Johannesburg, Coolgardie, Venezuela, Chile, Ottawa and innumerable other points outside the United States have been received inquiries. From every gold-bearing State in the Union requests for more explicit details have come.

This paper has tried to get from the inventor a sketch or some description from which a sketch could be made, or some details of construction, but without success, and refers to the matter here merely to give the reason why nothing more has been said about it.

The following is a letter under date of May 16th, '98, written to a California miner, whose inquiry addressed to the MINING AND SCIENTIFIC PRESS was referred to Mr. Benjamin:

I do not manufacture or sell the auger. I have made several successful examinations of gravel beds and old channels with a boring device of my own invention that I made myself. It is similar to an ordinary artesian well outfit—my improvement, consisting simply of a detachable bit, shaped something like the bit of a common plow—which will cut cemented gravel or other hard ground. I have never had it put on the market, as its use would never become common enough to pay. Truly, EDWARD H. BENJAMIN.

That the device suggested would be of universal value is manifest; and while Mr. Benjamin's well-known modesty might lead him to disclaim any efforts to make him famous, yet, in the interests of mining in general, it would be a matter of regret were so practical and useful an idea allowed to die with him.

MANGANESE ORE, while not abundant, is producible in several parts of this coast; some of the California ore carries up to 65% binoxide of manganese; it has to be rich to stand shipment, as the local demand is very light, chiefly in the manufacture of chlorine gas.

Treating Oxidized and Pyritic Gold Ores

P. H. VAN DIEST.

If all the free gold in pyritic ore is removed by amalgamation and the remaining pyritic ore ground up with mercury, some of the "not attacked" gold will be extracted from the pyrites, and the longer the grinding is prosecuted the more gold will be obtained. If, however, the pyrites are calcined until all the sulphur is driven off, the gold can be completely extracted by the means of mercury.

The mercury, to amalgamate actively, must be pure. To remove suspended impurities from small quantities of mercury, shaking with crushed loaf sugar is recommended. Larger quantities, where amalgamated impurities are contained, are best treated in a bottle or stone jar having a stop cock at the bottom, with diluted nitric acid, and stirring with a glass rod now and then, during a few days, thence draw off the required amount for amalgamation.

Pure mercury must make perfect round globules and leave no trail when run down an inclined glass plate. Gold amalgamates freely with pure mercury at ordinary temperature, when the gold is porous, or rather when its molecules are at uniform distances apart. Heavily pounded gold will not amalgamate freely, but, after annealing—that is, heating—it does so at once. For this reason grinding of the ore is in many cases better than pounding under stamps, i. e., slow stamping with high lift.

Treating the ore under heavy stamps with low and fast-drop, with quick discharge, when the rock is cracked as a nut without pulverizing the kernel, is yet the cheapest way for handling large quantities of rock. However, in that form the stamp battery is not an amalgamating machine—that is, no amalgamation can take place inside the mortar, and this must take place entirely on the plates outside.

No large lumps should be fed in stamps or in any other kind of mill. As a rule, the pieces should be broken to a size that will pass through a ring three-fourths of an inch in diameter. The best method is to break the ore near the mine in crushers separate from the mill, to prevent uneven steam pressure on the mill engine and to prevent jar to the amalgamating plates and other machinery in the mill.

The fineness of screens through which the pulp discharges from the battery depends on the character of the ore. If most of the richness is in pyrites, coarse screens, 30 to 40 mesh per square inch, is recommended, principally to prevent sliming in concentrating. If the gold occurs free in the quartz and the pyrites contain less value, finer screens, 50 to 60 mesh, should be used.

The tables outside the battery on which the amalgamated copper plates or electro-silvered plates are fastened, must be made free of the jar of the battery, be perfectly level in crossway direction, exactly fit to the table and be secured by means of wedges or cleats, but not with screws or nails. If the gold in the ore is coarse, short tables 8 or 9 feet long should be used. If the gold is fine, larger tables, 15 or 16 feet long give better results.

It is better to work with a small water supply and a high inclination of tables than under opposite conditions. Enough water should be supplied to make a thinly fluid pulp, never leaving dry places anywhere on the plates. Fine crushed ore requires more water and less inclination of the table than coarse-crushed ore. The water supply must be in any case such that sand can nowhere settle upon the plates, but is kept in motion in regular waves across the table. One-inch grade per running foot of the table is about an average grade. The amount of water used differs considerably with the kind of ore and mode of crushing. It will vary between 80 and 140 cubic feet of water per ton of ore crushed. The temperature of the water should be kept as much as possible between 60° and 70°, Fahrenheit. Lower and higher temperatures retard the amalgamation.

It is advisable to use mercury traps at the end of the table, so constructed that the pulps must go down to the bottom of the box traps and rise again, so that all the stray particles of mercury and amalgam be caught before reaching the concentrating tables and being lost with the tailings.

Besides, a mill should always by floored very substantially with a gentle slope and a gutter in the center to catch stray particles of mercury and amalgam.

The loss of mercury should never be higher than 0.03 pound per ton of ore. In several mills it does not exceed one hundredth of a pound per ton of ore. Mercury should be fed to a quantity of about three times as much in weight as that of gold supposed to be in the ore. When inside amalgamation takes place the mercury should be fed at regular intervals once every two or three hours into the mortar box.

The condition of the escaping amalgam through the screens as caught on the upper part of the copper or silvered plates gives a valuable indication as to the process of the amalgamation, and whether the proper amount of mercury has been charged. If it is brittle, granular and crumbles under the fingers, not enough mercury is added to the pulp. If thin, soft or pasty, too much mercury is used. The best way of feeding is with a wooden measure holding about one-half ounce of mercury, and dip this in a bottle, closely stopped, holding three to five pounds, drawn from the purifying mercury tank, and adding a little sodium amalgam, a piece the size of a pea to every pound.

The pulp passing through the mercury traps should be distributed over the concentration tables to separate the pyrites and other minerals from the quartz and clay gangue of the ore. The best way is to classify the pulp by using hydraulic separators, causing the coarsest particles to go over bumping tables, vanners or shaking tables and the finer material over slimers or puddlers.

For the treatment of the thus obtained concentrates different ways are open. If the mill is near a railroad, and not at too great a distance from a smelting center, shipping to a smelting plant is the best, and thus the greatest value for the gold in the concentrates can be obtained, smelting charges for pyritic concentrates, free from zinc, being low. If the cost of transportation is high on account of distance, it is advisable for a small mill, producing from one-half to two tons of concentrates per day, to roast them in heaps or stalls and run the roasted material through the mill again, or in pans with mercury. When the daily production of concentrates is greater it will be found more economical to treat them either by chlorine or cyanide. Chlorination gives the greatest extraction, but requires, previously, a complete roasting which increases the cost of treatment.

For cyanidation, gold must be very finely divided in the concentrates to be effective, but no roasting is required. If lead in ores to the extent of 7 to 10 per cent of the mass of roasted pyrites can be obtained, or 1½ to 2 per cent copper in ores be added to the amount of pyritic concentrates obtained, smelting or concentrating into lead bullion or an iron-copper matte is advisable. Matte smelting is preferable because matte is in a much better form to ship than concentrates, besides loss of gold in matte smelting is always much less than by chlorination or cyaniding; and, when the pyrites can serve as fuel, is cheaper.

THE Oregon is reported safe at Key West after a 13,000-mile trip from San Francisco where she was built. After such a long run it is announced that she is not in the slightest need of repairs of any kind, which is flattering comment on Pacific coast shipbuilding efficiency. The battleship Oregon is the heaviest armored of any ship in the world and in size is the same as the battleships Indiana and Massachusetts, these three being the largest in the American navy. The steel plates on the armor belt, barbetees and turrets are 17½ and 18 inches thick. She has four 12-inch guns and eight 8-inch, mounted by pairs in turrets. The size of these 13-inch guns may be imagined when compared with the guns of the Monterey (another San Francisco built vessel now lying here but ordered to Manila), which are 10-inch. There are four 6-inch guns mounted in broadside, twenty 6-pounders, six 1-pounders and five torpedo tubes for Whitehead torpedoes. The vessel's displacement is 10,288 tons; length over all, 864 feet; extreme beam, 70 feet; draught of water, 27 feet 8 inches. Her coal capacity is 1594 tons. The Oregon is rated a first-class battleship and has been in commission since July 15, 1896.

Mines at Mercur, Utah.

B. T. Lloyd of Salt Lake City and associates of Chicago purchased a few weeks ago a controlling interest in the Old Fred property at Sunshine, near Mercur. The price was on the basis of $80,000. The property has four distinct veins paralleling each other. Mr. Lloyd states that the mine is to be developed.

The Overland, in the same locality, has two shafts 170 feet and 160 feet respectively, and 7000 feet of drifting. Plans are made for a cyanide mill.

E. A. Wall has been prospecting on the Glencoe property, on the Sunshine side of the Mercur district, under a bond and lease from Durgy & Raddatz. This property has large bodies of ore, but of very low grade.

Judge Green and associates of Oakland, Cal., are sinking a prospecting shaft two miles from the foothills, in Rush valley. Their purpose is, if possible, to tap the west dip vein which outcrops where the La Cigale and Daisy are located.

The Daisy, under the management of A. H. Mayne, has a 450-foot shaft, which follows the dip of the vein of 52°. From this shaft levels are run at each 100 feet. At each of the four levels is an ore bin capable of holding 100 tons of ore, from which ore cars or skips are loaded and raised automatically to the bins at the mill. The mill is equipped with crushers, rolls, carriers and tanks for cyanide work. The eight tanks have a capacity of 300 tons per twenty-four hours. The mill, which is just being finished, will doubtless be operating by July 1st. The work on the levels aggregates 2000 feet. The vein runs in width from 2 to 25 feet. It is stated the ore averages $6.50 per ton and that it can be mined and milled at at $1.50 to $2 per ton. The hanging wall is a porphyry, overlain by a black clay shale, the footwall being limestone.

The La Cigale vein is in the same formation as that of the Daisy, but farther north. This property was described in these columns last August. Since that time the underground workings have been extended considerably, but the cyanide mill, which is well equipped, has not been running. The delay has been to await the result of some experiments. It has been decided to add to the mill a roasting apparatus. There are certain elements in the ore which have to be eliminated by roasting.

Near the crest of the mountain, separating the West Dip from the Mercur district proper, are the Northern Light and Chloride Point mines, both equipped with cyanide mills. These mines are on what is known as the silver stratum of the Mercur district. It is a ledge of chloride ore in which silver values preponderate, and which is imbedded below the main gold ledge of the district between limestone walls. The gangue rock is quartz, with some clay and talc. The mill at the Northern Light is running its full capacity of forty tons per day. The Chloride Point mill, which is claimed to have a capacity of 100 tons per day, has not started up yet. It will be operated by electric currents from the Telluride power plant at Provo.

The Mercur mill, located at Manning, is running at its full capacity of 300 tons per day. It has fifty-seven solution tanks, with three-fourths inch screens. It uses 300 pounds of cyanide per day. It runs exclusively on ores from the Mercur mine. WASCOTT.

Mercur, Utah, May 19th, '98.

Strength of Wire Rope.

Exhaustive investigation into the resistance of wires and wire ropes, both as regards tension loads and bending action, has been made at the government testing laboratory at Berlin, intended to investigate the resistance both of single wires and of the same wires twisted into rope. In general the following deductions were made: The endurance of wires under repeated bending over a uniform radius of curvature diminishes rapidly with the increase of load up to loads of about 6000 pounds per square inch, but for further increase of load the reduction in endurance proceeds more and more slowly. The endurance under repeated bending from increasing loads, diminishes the more rapidly the less the resistance and the greater the extensibility of the material. The influence of increasing radius of bending upon the endurance was rapid at first, but showed a continually diminishing importance above fifty diameters of the wire.

These tests, as well as the tests of wire ropes, were made upon wires of various strengths, in order to obtain a progressive series of points through which curves could be drawn. The tests with the ropes were made upon the materials used for the single wires, so that a series of relations between a given wire and a rope made from the same wire were established. In some instances the strength of a rope per unit of cross-section was greater than that of the single wires of which it was composed, but in others it was much less, depending upon the material and the conditions of test. This work was undertaken especially to furnish data for the use of wire rope in connection with the mining industry of Germany.

Rubber From Corn.

Chemists of the Glucose Sugar Refining Company claim to have discovered a process for vulcanizing the oil from corn in such a manner as to produce rubber. They say this will revolutionize the rubber trade and give them control of at least the manufacture of bicycle tires. Five chemists in the employ of the company have been working on this innovation for some months past. According to reports, the chemists have found that the oil of the corn properly treated and vulcanized is superior to that of the product of the South American rubber tree, is more resilient and more lasting; and it is said that the manufacture of rubber under the new process will become an important part of the business of the glucose company. The process was accidentally discovered some months ago. It is also said that the new process will greatly lessen the cost of rubber, especially that variety that is used in the manufacture of bicycle tires, which is required to be thin, durable and resilient. It is claimed that the new variety of rubber will withstand much more pressure than that now in use for tires and that it will offer more resistance to outside force.

LIGHTING the pyramids of Egypt with electricity and the installation of a 25,000 H. P. plant, to cost some $400,000, is a plan now under consideration by the British Government, and an American firm is reported as likely to receive the contract. As outlined, the plan includes the generation of electric power at the Assouan falls, on the Nile river, and its transmission a distance of 100 miles through the cotton growing districts, where, it is believed, the cheap power will permit the building of cotton factories. It is planned to use the power to illuminate the interior corridors of the pyramids, and also operate pumping machinery for irrigating large areas of desert along the Nile.

Mining Summary.

CALIFORNIA.

Amador.

The shaft at the Amador Queen is down 1000 feet. A drift is being run from the 300 level in ore, and Gen. Mgr. Dye will make a test run of it.——It is said that in the Central Eureka, at Sutter Creek, a fine body of good ore has been found.——The Sutter *Record* says that at the Potazuba mine the north drift is in over 300 feet and the ore vein is increasing in size.——The *Dispatch* is informed that the Iron Mass is idle, preparatory to sinking the shaft. The Iron Mass has proved itself to be, so far, as good as its owners expected.——Col. Ranlett, owner of the Copper mine at Newtonville, is sinking a shaft on a chimney that has not been prospected. There is a report that he will start up the old works in a short time.——The Iron Bound, or Douglass mine, near Volcano, is being steadily worked and good ore prospects obtained. A hoist is being put up on the old Soracco shaft by this company, which proposes to clean out the shaft to its depth of 450 feet and drift back to the Douglass shaft.——At the Ivanhoe, near Plymouth, J. A. Brent is adding fifteen stamps to the five in operation. A new hoist will be put up and sinking will be started within a few days. The shaft is down 225 feet. Steam power will be used.——The *Republican* says there is a prevailing idea that the Anita will be the next mine in Jackson to put up a mill.——Very hard rock was struck in the Amador Queen No. 2, which caused slow sinking. The rock is softening and the regular average work per day is being done. The shaft is down 430 feet. Supt. Phillips will put in machine drills as soon as they can be worked to advantage.

Butte.

It is said that the Chinese Co. that leased the Big Bend Co.'s ground, near Yankee Hill, two years ago, will operate on the river this summer.——M. Clark & Co. are developing a claim on the North Fork.——Clark & Co. are working their channel claim.——Farley & Scott are getting their claim in shape to make a good run this summer.——It is reported that pay gravel has been struck at the old Buchanan Hill mine.

Calaveras.

At West Point the Oriental will make a shipment of sulphurets this week.——J. Barnhart & Co. had six tons of rock crushed from their claim. It netted over $46 per ton.——Developments on the Harrison continue. Supt. Musgraves is milling twenty-five tons as a test. It is reported that the plates are looking well.——Sterling Bros. & Co. are crushing Wide West rock. It contains a large percentage of sulphurets. The concentrates will be shipped.——The Eaton G. M. Co. of New York has commenced operations on property near town. A double compartment shaft is being sunk. It is the intention of the management to add machinery in the near future. O. Eaton is Supt.——Manly & Gibson have their mill in operation and are crushing ore from their own property. They have a good-sized ledge and enough quartz in sight to keep the mill running for some time.

Sulphurets from the Keltz mine at West Point, at a depth of 650 feet, assayed $800 per ton. The lead in the Keltz is about 20 inches wide and the rock assays $50 per ton. The work of shipping the ore has begun.——The Oriental is working under the management of J. M. Burns.——O. F. Eaton has put men at work on his mine.——The Champion mine has resumed operations after a lapse of nearly twenty years. Twelve men are at work. A new gallows-frame has been erected, the shaft has been cleaned out and retimbered down to the water line and a new 6-inch pump placed in position. A 2-stamp, triple-discharge mill is nearly ready to run. A portion of the old dump has been sorted, yielding a number of tons of first-class ore.——The Machu mine is producing good ore. The Supt. is H. C. Woodrow.

The Paragon, Keltz and Empire are working a dozen men each.——The south shaft of the Gwin is unwatered to a depth of 85 feet lower than the old 1200-foot level, and pumping is still going on. No. 2 station pump is now being put in on the 1200-foot level. Some good ore is being mined at the 1400-foot level. A rich strike is reported on the 1000-foot level running south, toward the old workings.

El Dorado.

(Special Correspondence).—Whilst little has been said concerning the dearth of water in this county, we will be obliged, like some of our neighbors, to share a like fate. The Gold Bug M. Co., which has installed an extensive plant near Georgetown, after two years of preliminary work finds itself obliged to await the snows and rains of a future season.

The organization of a company is announced that will begin work on the Ida Mitchell and Gold Bug quartz properties in the heart of the town of Placerville. Both properties have yielded considerable gold, but were never worked to any great depth, nor with much system.

Work has begun on the Crown Point group, recently sold to a Scotch company.

Pascoe & Secomb are working the old Jeffreys gravel mine and meeting with success.

W. G. Sheffield of St. Louis bought the surface plant of the Pocahontas for J. B. Mellor of the same city. A renewal of the option on the mine can be obtained and it is quite probable that work will be resumed shortly, though so far as Mr. Mellor is interested the purchase was purely speculative.

Placerville, May 24th, '98.

E. M. Dunker is taking out good milling ore near Sweetwater.——H. Carey is running a 2-stamp mill on high-grade ore near Josephine.

Republican: Most of the men working at the Taylor mine were discharged and the force cut down to eight hands. The impression has got out that the mine has been sold to an English company and the cessation of work is merely preliminary to whatever changes the mine owners wish to make in the working of the mine. The Taylor mine has been steadily operated for a long time and has reached the depth of 1258 feet.

Kern.

The Rand Mountain mine is one of a score or more claims on Rand mountain, owned by the Yellow Aster Co. The regular income of the Rand mine each month for the past three months is said to have been over $40,000, and some months considerably more. Much more ore could be taken out if milling facilities were more extensive. At present 1600 tons of ore are mined monthly by the Yellow Aster M. & M. Co. The ore from the Rand, which is milled at Garlock, averages considerably over $30 to the ton. Plans are now being drawn for a big mill to be part of the Yellow Aster plant. Thirty stamps will be the first capacity of the mill, and steam power will be used. It will be arranged to add more stamps up to 100. The ore is said to be improving.

There has been a good strike of copper in T. Johnson's mine near Randsburg, at a depth of 162 feet.——Work has resumed on the Merced mine.——The first carload of ore shipped to the new mill at Barstow was shipped from the Kinyon mine last week. The car contained fifteen tons.——A number of men were discharged from the Yellow Aster group owing to the lack of milling facilities. The company has quit milling at Garlock, and it is said they intend to send much of their ore to Barstow as soon as the new mill begins operations. In the meantime the mill at Johannesburg keeps five stamps dropping on Yellow Aster ore.

Mono.

Foch & Johl are developing a property near Bridgeport.

Nevada.

(Special Correspondence).—The Phœnix M. & I. Co., that resurrected the old Sneath & Clay mine, near Nevada City, are meeting with good success in their work. This mine had been abandoned since 1868 and was consequently flooded. The property was taken up by the present company on the merits of its early history. The depth reached in its early work was 450 feet. The present company unwatered the shaft and began drifts on the bottom level. They have found a 20-inch ledge of very fair grade ore, the lowest of which mills $17 per ton. The property is operated by an Eastern company and Dr. Tickell of this city. H. K. Shockley is Supt.

Nevada City, May 24th, '98.

Placer.

(Special Correspondence).—The starting up of the mill and cyanide works of the Forest Hill M. Co. notes the point of change in the nature of the mining on which this town is dependent. The marvelously rich drift mines that in the aggregate yielded about $25,000,000, are no longer gold producers to any extent, many of them being completely worked out and abandoned. Forest Hill has never hitherto been considered a quartz mining district, being supposed to have only placer mines. In early days, in the '50s and '60s, some quartz ledges in Volcano canyon, between Forest Hill and Bath, were worked, and the quartz crushed in small mills and hand-mortars. The ore is said to have been high grade, but placer mining gave so much larger returns that the quartz mines were abandoned; and in time it came to be believed that they were abandoned because they were only pockets and worked out by the old miners. One of these mines is the property of the Forest Hill Co. It has before been known as the Spanish mine, because owned by Spaniards. It was supposed to be a porphyry dike containing pockets that were very rich. The Spaniards washed the surface of the ledge off by sluicing and hydraulicking, and worked some rich rock in arrastras. The experts who have examined it for the Forest Hill Co. say that it is not a porphyry dike, but a true lode of a new kind of gold-bearing rock. The dike or lode is from 50 to 200 feet wide in serpentine walls. All of it contains some gold, but the mill failed to save the gold by amalgamation. Seven-eighths of it is said to have been lost with the tailings in the first run made. The Forest Hill Co. claim that the loss of gold was because of its extreme fineness and flour character, and that tests made by the cyanide process show that it can be entirely saved by that process. The mill capacity has been increased to thirty tons daily and a cyanide process works constructed. The successful operation of this mine will make up some of the drop in annual gold production of Placer county, due to the working out of the drift mines, and it will keep Forest Hill town up to its old importance as a mining camp. The amount of ore in sight in the lode cannot be worked out in twenty-five years, even with the cyanide plant built up to 400 tons a day capacity, as promised by the company.

Forest Hill, May 25th, '98.

Bassett Bros. of Oakland have begun work on the Mountain View mine near Auburn. If tests prove satisfactory they will build a mill and put in concentrators.—— Development work is being rushed at the Marguerite mine.——The Jupiter M. Co. will begin work shortly on their gravel property near Iowa Hill.

Herald: C. H. Porterfield is pushing work on his mines near Emigrant Gap. His steam power plant is completed and the 10-stamp mill has started. He has thirty men on the pay roll and will keep the mill going steadily. There will be a great deal of prospecting done in the high Sierras this season, as there is no snow to speak of and prospectors have been on the ground for some time past.——New machinery will soon be erected on the Evening Star mine on Rock creek. Thus far the prospects have been encouraging and the indications are that the Evening Star will be one of the regular producers.——E. W. Chapman is making preparations for the opening up of the old Calf Pasture mine on Rock creek.

Plumas.

The Drury mines, near Quincy, are yielding well. The ore is averaging $8.50 per ton.——The Golden Channel Co. has concluded to sink a larger shaft.——R. M. Green of Oroville bought the Lodge interests in three mining claims near Buckeye and leased them to T. G. Harrison. The lease is for one year and the lessee is to develop the mine and work the ore. The mill will be running in a month or five weeks. The improvements on this property consist of two shafts and two tunnels, one of which is run in on the ledge about 190 feet and the other is a crosscut 60 feet. This tunnel will be pushed ahead night and day. Present developments show a ledge about 18 inches in width which assays $25 per ton free gold and sulphurets, which assay $150 per ton.

Twelve men began work last week on Minerva Bar, near Onion valley.

San Diego.

Development is progressing on the tin mine of D. B. McIvers at Poway. Its area covers about five acres on the surface. No effort has been made to place the property on the market. The assays of the ore show 5 per cent tin.

Shasta.

O. La Plant at Keswick is developing a 5-foot ledge of ore that mills $20 per ton.——The Milk Maid mine at French Gulch, with four stamps last month produced $13,000.

Bryan & Dittmar have begun development work on a property near Redding.

Sierra.

The Plumas *Independent* says it is locally reported that the Garnett Con. properties near Gibsonville will resume operations, the result of a compromise between the company and its creditors.

The *Enterprise* says that the Clay Bank tunnel, near La Porte, is to be started again and pushed ahead as fast as possible. Three shifts will be employed.

Siskiyou.

Musgrave & White at Humbug are running a tunnel on the Lost Lenore and are in 60 feet and have a 20-inch vein of rich ore.——Culver & Plummer have found some stringers on their property which prospect well.——W. Clarke of the Uncle Sam mine has closed down the property.——Caskey Bros. on French creek are still ground sluicing and have been working all winter. They have sufficient water now to work indefinitely.——The American Bar claim on Klamath river is yielding good returns, and work is prosecuted day and night with a force of thirty-eight men.——B. Daggett has returned to Black Bear, where it is stated he will make some extensive improvements. The company intend running a lower level and putting in new machinery to enable them to develop the property.——The property owned by Ball, Traverse & Johnson on Six Mile creek, which was recently opened, promises well. The new shooter put in this summer is working to perfection.——At the Brown & Reeder mine in Fools Paradise district a tunnel has been driven, and at a distance of 18 feet from the mouth of the tunnel they began stoping the ore. During this process a pocket was struck in the stope which yielded $450 the first day. The gold was pounded in a hand mortar. One feature of the find is that the mint returns show that the value of the gold is $18 per ounce, while the average value of quartz gold from this locality is between $15 and $18.

Journal: Andrews & Gallagher had a crushing from their ledge which paid about $200 for a few tons; they have just taken out another lot.——F. Le May has an 18-inch ledge from which he is taking out good pay. He took out a small lot that netted him $200 at the mint. He struck a small pocket, one panful of the decomposed quartz yielding $18 in washing.——Mr. Shearer purchased the old Cartwright & Phillips quartz mine on Humbug and is having a test made of the sulphurets.——In the Pacific mine Supt. A. Smith has completed dams for the keeping out of water. The river bed is of sand formation.——W. F. Shurtliff, who is working a quartz ledge on north fork of Humbug, above the old Eliza ledge, has been doing well lately. His ledge varies from 18 inches to 2 feet in width, and he has a 2-stamp prospecting mill. At present the quartz averages $25 per ton.——The river mines in the Honolulu district of Klamath river have completed their wing and head dams, and are rapidly sinking cuts to bedrock, some being down 20 feet or more. In a short time they will all be hoisting pay gravel from bedrock, which ranges from 35 to 50 feet deep. The early start this season by reason of low water in the river will give the miners a long season to open up a large extent of the river beds and its banks.——The hydraulic miners on the lower Klamath will not have a good season this year, owing to the scarcity of water in the creeks emptying into the Klamath, but they will put in the idle time in fixing up in good shape for next season.——The Morrison & Coburn quartz ledge at Quartz valley has been paying well for some time, yielding about $2000 a month. A force of fourteen hands is employed getting out and crushing quartz.

Journal: The Cherry Hill mine on Cherry creek prospects well. The ledge averages 3 to 4 feet wide, and all the ore bins full, without any chance to crush for lack of water.——The American Bar claim on Klamath river is being worked day and night with a large force.——J. O. Jillson & Co. are adding five stamps to their mill at the Norfolk and Lodi ledges near Henley.——The Golden Jubilee quartz mine at North Fork of Humbug is being worked day and night with eighteen men. The ledge varies from 1 to 4 feet in width.——F. LeMay found another pocket in his quartz ledge on North Fork of Greenhorn, from which he realized $300.——Brown & Reeder made a cleanup of their 2-stamp mill on Shasta river, in Fool's Paradise, and realized $2150 for a week's run. The ledge averages from 14 to 18 inches in thickness.

H. J. Barton is reported to have struck good pay in his wing dam at Oak Bar.——The Distlehorst & Barton dredger is working steadily near the Collins place on Klamath river with good success.

Trinity.

The Highland mine at Taylor's Flat has shut down for the season, owing to the scarcity of water.

Tulare.

The placer miners near White river claim to be cleaning up from $4 to $5 a day.

Tuolumne.

Good ore has been found in the Republican mine.——The Nourse property has been bonded and work will begin on it shortly.——The Rawhide has increased its working force in the mine.——In the Mount Jefferson mine sinking and drifting goes on day and night.——Day and night shifts are working in the Big Oak Flat Nos. 1 and 2.

Democrat: At the Grizzly the underground workings are being rapidly opened up, while thousands of dollars are being expended in new improvements. All work on the property is being done under the personal direction of Supt. Sharwood. The new shaft is down 320 feet, at which point sinking was temporarily suspended. The present principal point of operation is at the 280-foot level, drifting on the vein, beside upraising to the next level. The ledge averages from 6 to 8 feet of quartz, all of which is good and much of it high grade. It carries a heavy percentage of rich sulphurets. Work on the new 20-stamp mill is under way, and its stamps will be dropping within thirty days. It will be run by water power. This same water, after doing duty at the mill, is carried several hundred feet in pipes, and also operates the hoist, good for sinking 1000 feet. The pulp from the mill will be transmitted in sluices across the river, a distance of 700 feet, to a concentrating plant, where eight concentrators are now being put in. The Grizzly has produced $1,000,000 worth of bullion, at one period yielding $7000 per week right along, and that with all the hoisting done by hand and no concentrates being saved.——At the Providence the main shaft is down 290 feet, showing in the bottom 6 feet of rich rock. At 300 feet the second level will be run. Drifting at the 150 level is in progress north and south on the vein. In the shaft the last 50 feet of sinking marked an increase of more than 1 foot in the size of the vein of high grade ore. The old tunnel workings have been abandoned, but will eventually be tapped from the shaft's levels. Already 1500 tons of ore from the shaft are on the dump. A large force is at work grading out a foundation for the new mill, and the plant will be completed and running within sixty days. About seventy men are employed under the superintendency of W. Berry.——At the Gerrymander the main double compartment shaft has been driven past the 100-foot mark, at which point they are crosscutting. Sinking will be continued until the shaft is 500 feet deep, and levels will be run at every 100. When the vein is crosscut at the first level the ore from the quartz body will be sufficient to keep the mill steadily running. J. Joseph is Supt.——Work on the Barry mine, which is on the same lead as the Providence, was commenced last week. The main tunnel is in 150 feet and shows 3 feet of good ore.——At the Seminole nothing is being done but keeping the mine clear of water. Just when active operations will be resumed is as yet uncertain.

NEVADA.

H. W. Ely of Dayton took a bar of bullion to Virginia last week, probably the finest gold ever seen in that camp. The bar was from four tons of ore from the May Day mine in Como, which was worked at the Wilson & Bliar arrastra at Dayton, and was valued at $280. The ore yielded at this rate $70 per ton, and the gold was valued at $19.03 per ounce.

High-grade ore has been discovered in the Heleza mine, near Genoa.——J. Wall is developing a claim that carries good ore values.——H. W. Ely obtained from four tons of ore from the Mayday mine, in Como, $280.——On the dump of the Homestake mine at Hamilton there are 600 tons of smelting ore carrying 65 per cent lead.——Developments in the Star mine at Cherry Creek are showing up good bodies of ore. In the near future a mill with 150 tons a day capacity will be erected on this property.——On the property of the Boston & Nevada M. Co., at Yerington, work has been resumed, the intention being to prospect lower levels before undertaking to operate the matting plant again.

Times: The Douglass mill at Dayton, which started up last week, shut down after an unsuccessful run on the Douglass tailings. We are unable to give any figures of the test run, but the process does not handle the material at a profit.——C. Boyle will begin development work soon on the North Rapidan mine at Como.——The Overland mine, in Silver City, made a strike of fair-grade ore.

OREGON.

Walker & Piper have resumed work on their hydraulic property near Grants Pass.——J. Cox continues work on the Lucky Bart mine.——The Boynton & Fuller mine began crushing ore.——The Dana & Bingham mine struck a good quality of ore.——The mill on the Virtue mine at Baker City has started crushing 100 tons of ore from the Collateral mine.

WASHINGTON.

Near Springdale the Copper Giant Co. No. 1 is sinking on good ore.——Assay returns from Oro Fino ore yielded 31 per cent copper and some gold and silver.——Cottrel & Chappel are developing a copper prospect.——The Cleveland is making carload shipments of ore.——In the Delaware mine, near Republic, the ore assays $4.65 gold, 3 per cent copper and 26 per cent iron. The property is being extensively developed.

The Cascade M. Co. of Milwaukee is locally reported to have bought for $250,000 twenty-

four placer claims in Swauk district, Kittitas Co. The claims are now worked with hydraulic machinery, using the water of Swauk and Williams creeks. Their former owners have been taking from $5000 to $20,000 a season out of the best of them, working in the most primitive way. The gold is found chiefly in bars, which cover the old creek channels along the banks of the Williams, Swauk, Boulder and Baker creeks.

Work will be resumed shortly on the Little Giant mine near Colville. The property has over 500 feet of underground work, and had made one shipment.——In the Rustler mine at Meyers Falls a ledge has been found that is 60 feet wide and well mineralized.

BRITISH COLUMBIA.

The Le Roi M. Co. has been assessed in Spokane for $2,000,148.08. The company has filed a protest against $2,000,000 of the assessment, which represents the company's mining property at Rossland, or the stock representing the same.

A Rossland paper says: "The greed of the owners of the Le Roi mine brought a miners' strike about this week. They sought to make the miners work ten hours a day, instead of eight, for $3.50 per day, and in consequence thirty of the men quit work. As the mine is changing hands, it is likely that the new owners will have to settle the difficulty."

Captain R. A. Parker returned to San Francisco last week from Rossland, B. C. He says the country is unprepossessing, but the values are there. It is a smelting camp. The Rossland ores are sent to the smelter at Trail, a distance of seven miles. The country is a mass of eruptive rocks running in diorite and granite. The ores are in a fissure of aurgite porphyrite that is very hard. The ores are sulphide, carrying gold, silver and copper—enough copper to make a good collecting medium. The ore bodies vary from 1 foot to 16 feet in width and are fairly persistent. The general tenor of the gold value is from $16 to $50 per ton. Capt. Parker says Rossland promises to be a big camp, and permanent, too.

Near Ymir development work on the Bullion group shows seven leads within 500 feet. One ledge is 2½ feet wide and the ore is good grade. The ledges on the Woodside have been opened up in ten different places and in each a fine vein of quartz has been discovered. The ore from both the Woodside and Bullion runs well up in gold and copper.——Near Grand Forks work is being pushed on the O. K. and Lucky Boy properties. The ore now on the dump is said to assay from $80 to $100 in gold.——At Rossland the B. A. Corporation is pushing work on several properties. Supt. Macdonald is working four drills on the Columbia and Kootenay night and day. A raise is being run from No. 3 tunnel. It is in a good body of ore at 60 feet, with neither wall in sight, although the raise is 6x7 feet. A force is at work on No. 4 tunnel and making good progress. Power has been introduced into the work on the Great Western. The shaft is down 100 feet. Two drills will be used in sinking. The Josie is employing about twenty men, and pushing work. Two drills are in use on the 300-foot level. Work is continuing in the Poorman, but no notable results are reported. A new lead outcropping is being prospected.

At Rossland the War Eagle Co. will shortly start work on the Crown Point claim.——Work has been resumed on the Big Four.——A strike has been made on Sunset No. 2; nearly 2 feet of high-grade ore were opened. Several tons of this have been broken out, and average assays are about $52, of which over $30 is gold.——The lower tunnel on the Jumbo is in 825 feet.——The Iron Mask has commenced to drift in the ore body recently opened in the winze from the 300-foot level.——The force on the Victory-Triumph has been doubled by D. B. Bogle, the Mgr., and work is being prosecuted in two places. A parallel ledge about 25 feet from the main ledge was discovered last week. It is about 6 feet wide and carries good values in gold. The old ledge carried its principal values in silver and copper. The new find is being thoroughly prospected.

Assays from samples taken from the Beattie claim, near Trout Lake City, gave seventy-six ounces silver, $47 in gold and 84 per cent lead.——Sixteen carloads of high grade ore from the Silver Cup mine were shipped to San Francisco.——Work continues at the Bad Shot mine.——The Keystone and Ethel will shortly be developed and a shipment of ore will be made.——The Waverly mine will resume operations as soon as the wagon road permits. The company will employ about 150 men.——It is stated that the owners of the Monarch mine, at Field, contemplate putting a smelter in the valley below the mine.——The Union Jack, near Cranbrook, has been bonded for $10,000.——F. Heap of Ainsworth made a carload shipment from the Pontiac and Tecumseh claims. The properties are developed by a 250-foot tunnel. The ore will average 125 ounces silver, $12 in gold and about 30 per cent lead.——On the Number One, Ainsworth, thirty-four men are employed, and sixty tons of concentrates a month are being shipped. There are two grades, one running above 160 ounces in silver, the other 375 ounces. The best ore without concentration averages 100 ounces.

A good strike is reported in the Bolander mine in the Slocan.——The Monte Christo and Colonna property at Rossland has begun shipping fifty tons of ore per day.——A one-fourth interest in the Narmo C. group at Ymir was sold to T. Kereeme for $4000 cash. This property has a ledge of gold and copper ore running across the entire claim.——N. Cochrane of Rossland has taken a bond for $30,000 on the Royal Banner and St. Clair claims in Summit camp. Two shifts have been put to work.

ALASKA.

Mining News: The officers of the Jualin M. Co. received a gold brick valued at $5000 on Thursday last. This was the proceeds of fourteen days' run with ten stamps. The company anticipates a most successful season. The ore is plentiful and the thirty men employed find no difficulty in keeping the mill fully supplied.

THE KLONDIKE.

The Rufus E. Wood sailed this week, carrying a party of forty civil engineers and mechanics who are sent out by a London and New York syndicate to survey a railroad from Norton sound to the nearest point on the Yukon, intended to make a saving of 300 miles in the distance to Dawson.

UTAH.

Two cars of concentrates were shipped from the Galena of Bingham.——The Sunbeam made a shipment of ore.——Another shipment of silver and lead ore was made from the West Argent at Stockton. A similar lot a short time ago showed 45 per cent lead and 45 ounces silver.——The Cigale will make a connection at a depth of 600 feet between the Boston and discovery shafts, that are 500 feet apart. The latter shaft is being sunk and at a depth of 600 feet drifting along the strike of the big vein will be commenced. As soon as the merits of the roasters are determined work on the Cigale mill will be resumed and the plant put forward to early completion. It has become generally known through experiments at the Golden Gate that less of the cyanide of potassium is required to successfully leach the ore after it has been roasted, while at the same time a higher percentage of the values is saved.——W. J. Nelson returned from California and is again giving his attention to his mining properties. The Charlie Ross has been idle for several weeks, but the doctor will renew work in a short time and prosecute its development with dispatch.

At Mercur work on the Tioga is being prosecuted in the tunnel. A distance of 200 feet has been reached.——The Columbia Co. has let a contract for sinking the shaft 50 feet, which will give them a total of 200 feet.——N. W. Jones sent to Salt Lake the semi-monthly shipment of cyanides, from the Geyser-Marion, worth about $7,000. —— J. Nichols made his first shipment of silver-lead ore from the Buckhorn. The consignment brought good returns. Work in the Overland mine is progressing rapidly. The main shaft has reached a depth of 200 feet. At the same time the incline being run on the vein from the old workings to connect with the shaft has been driven a distance of 170 feet and all the way a fine body of ore has been gone through.

The White Pine group has a quantity of lead ore on the dump which will assay about 25 per cent lead and from 60 to 140 ounces of silver. An incline has been run 300 feet and in the face the vein is 6 inches in thickness. A shipment will be made soon. —— In the Resolute shaft of the Mercur mine at 500 feet depth an 18-foot vein has been found of fair milling ore.——Drifting is going on in the Mattie ground. Ore in the face of the drift shows values as high as $10.——In the Lulu the air shaft is 500 feet. In upraising a 7-foot body of ore was cut of good values.——W. W. Orr, resident representative of the Gold and Silver Extraction Company started up the new mill at Lion Hill with which the ores of the Chloride Point are to be leached. Concerning the ores of which the mine is productive, Mr. Orr says, after repeated experiments, that they afford as nice a leaching proposition as any he has ever experimented with.——The Ontario at Park City it is said will put through 100 tons of tailings a day by June 1st.——Work has begun on a plant to handle the tailings and a certain variety of ore of the Silver King.

Tribune: The Galena of Fish Springs marketed 115 tons of ore the past six months, from which the company derived $10,783.49, or an average of over $93 per ton. For three months previous to the period covered by the shipments no ore was hoisted. The time was devoted to putting in a new hoist and the exploration of new ground, while for the quarter antedating that no record was made. In the marketing of the ore $14 per ton was paid for transportation. The cost of smelter treatment was light, the last shipment with which the company reported and which yielded as much as $1750 in silver and lead, commanding a premium. It ran high in lead in addition to a fine showing in silver, while the output for six months afforded an average of 50 per cent lead and a little over 100 ounces silver per ton. The report from Supt. Hoffman shows the mine in excellent condition.——The Hatfield at Tintic is shipping high grade ore. ——The Martha Washington made another large ore shipment. —— The Utah at Fish Springs shipped 22,000 pounds of fair grade rock.

Tribune: Although he has refrained from making announcement of the fact, Mgr. Cohen of De Lamar's Mercur mines acknowledged that he had already made three cleanups of auro-cyanide at the Golden Gate mill and that he would repeat them at intervals of every four or five days. The tanks, which represent a total capacity of 2700 tons, have ceased leaking and the output will reach a total of 500 tons a day. At present Mr. Cohen is conducting some experiments on a large scale in the lixiviation of the ores, and the result will determine whether or not he will roast all of the ores, whether they are of the sulphides or oxidized. To that end he has one tank filled entirely with ores that have passed through the roaster and another filled only with raw ore. The leaching that affords the best result will in the future be used. Meanwhile the results thus far obtained are said to be quite satisfactory.

The Central Eureka at Eureka is shipping twenty-five cars of high grade ore per month. ——The Treasure Hill has reached a depth of 385 feet. The weekly shipments will reach 125 tons.——The shipments from the Tintic district for last week were twelve cars of concentrates, seventy-six cars of ore and twenty-five bars of bullion.——Ten cars of ore has been shipped from the Iron mine and two from the Treasure Hill at Silver City.

IDAHO.

Work on the double-compartment shaft at the Twin Sisters mine, near Centerville, is progressing.——Development work on the New York and Jupiter mines continues.—— The Twin Springs Placer Co. has begun piping.——The tunnel on the Accident mine is approaching the 100-foot mark.——Bowen & Jordan contemplate erecting a large mill at the Revenue mines on Elk creek.——C. E. Taylor sold a half interest in the Golden King mine near Dixie. A strike has recently been made in the mine of great value. A mill has been erected and is about ready to run. The cyanide process has been introduced after thorough tests made at the experimental works in Denver.——A big body of ore is reported cut in the Tyrannis group of mines in Little Smoky. This ground was supposed to have been worked out.——J. J. McDonald started work on an extensive enterprise near Lardo, near the Payette lakes, on a contract from Dr. Law of California to build a canal for placer mining, to be seven miles in length and 10 feet wide on the bottom. The contractors expect to complete the work in three months. Dr. Law has secured a large tract of placer land near Lardo and expects to work it. He is an old miner, having been connected with placer mining in California since the early days. His home is in San Francisco.

Times: A vein of ore carrying over 1200 ounces of silver and 14 per cent of copper per ton was cut in the Pass group of mines, near Hailey, a few days ago. The seam is being explored in order to ascertain its extent. This is said to be the first copper ore found in that vicinity.——The Golden Star M. Co. is putting the Camas No. 2 mill in working order, and will begin a trial run on its ore at the earliest opportunity. The cyanide works at the Camas No. 2 group of mines are ready for the summer work, and Mgr. Frank began filling the tanks, which will be in operation until frost compels a shut-down for next winter.——At the Golden Star group, on the Gold Belt, they began sinking to the 300 level.——S. T. Pearson has begun work at the property of the Bingham Placer M. Co. at Gibbonsville. He reports the adjustment of the hydraulic elevator about completed, and expects to be able to begin the washing of gravel again shortly.

The mill on the property of the Lucky Boy M. Co. at Custer City has started again and is running on good ore. Fifty-five persons are employed on the mine and mill, while directly and indirectly employment is afforded about 100.——E. Burson found a ledge near Idaho City that is 10 feet wide and yields good returns.——It is locally reported at Delta that M. Craven contemplates building a 5-stamp mill this summer to work the ore from the Pony mine.——In the Chloride Queen mine, near Wallace, they are working in 2 feet of good ore. The values are gray copper and some gold.——The Father Lode mine has found a new and valuable ore body.——The Sonora M. & M. Co. at Burke has let a contract to extend their tunnel 500 feet.——Mgr. Wiley is operating extensively in placer mining near Grand View.

MONTANA.

The placer mines at French gulch are in operation, and will be worked as long as water lasts. W. R. Allen has several men at work. The Tacoma Placer Co. also has a force at work and I. W. Farrell a small force.——Another gold brick from Yahk ore was sent out, the product of the Goldflint Co.——Bartlett Bros. & Co. have ten tons of ore on the dump on the Merry Holiday mine at Revenue.—— The Monitor Co. at Revenue shipped 180 tons last month. The Monitor Co. has also 1000 tons of second-class ore on its dump.——Two weeks ago the ore shoot on the Lyons lease on the Arkansas, at Revenue, was lost. Last week the ore was rediscovered. The value is not high, but the vein is wide. The assays indicate from $30 to $50 a ton.——Dallen & Walin of the Heart Solo mine have four tons of good ore for shipment on the dump.——The Washoe Co. has secured under bond and lease and partly outright purchase, it is stated, the Hesperus, the Lizzie, Yellow Jack and the Colorado Fraction lode claims, all close to the Hesperus lode claim. The entire consideration is said to be about three-quarters of a million dollars. Extensive developments will take place. The Hesperus is one of the best known claims which passes to the Washoe Co., and though there has been some money spent in development work and no pay ore bodies so far discovered, many mining men say that with depth there is likely to be found large veins of good copper ore. There is a well-defined lead on the south side of the Hesperus and one also known on the north vein on which a shaft has been sunk and considerable development work done. For over fourteen years the Hesperus lode claim was in the courts and title in it was finally awarded to J. A. Murray and his associates, Mr. Murray owning a large interest in the property. The Lizzie lode was owned mainly by Hickey brothers. The title, like that of nearly all the claims in that vicinity, was for a long time in contest, but has been settled. The Yellow Jack was in dispute for years and finally the surface was deeded to certain claimants and the mineral rights to P. Mullin, who has now transferred it to the Washoe Co. It is stated that the Washoe Co. will sink 1000 feet on the Hesperus and a shaft the same size will go down on the Yellow Jack in the near future. Some extensive crosscutting and exploration work will be done on all the claims before next fall.

Ore hauling continues from the Duck Creek properties, near Townsend.——C. P. Abbott has begun operations on the Cecil W.——J. T. Ingram is placing hydraulics on his diggings on Deep creek, and expects a busy season.——Glora & Mills have shipped some ore from the Ohio mine, in Jefferson county, that runs nearly six ounces in gold.——Ore is being taken from the Elgin mine at Rochester.—— M. Bullet reports a good strike in the Locket at Rochester.——J. Miller has a 2½-foot vein of good ore in the Watseca.——G. Cudmore made a shipment of ore from his lease at Neihart.——The *Miner* says that a strike was made in the Keystone, near Sylvanite. The ledge was reached at about 492 feet and the tunnel is in over 500 feet and still in ore. The crosscut will be continued and the full width of the ore body learned before drifting. Until this work is accomplished it is not probable anything definite will be known as to the size of the new mill to be erected; but from present indications, a plant of considerable magnitude will be erected. In the upper level the vein is known to be 60 feet wide and one wall yet to be found.

The Silversmith mine near Basin is added to the list of shippers.——The Rose mine is milling ore at the Boulder mill.——The Hope shaft is down to the 400 level, and work around the mine is rushing.

The Eva May has resumed ore shipping.—— Near Hassel, Patch & Wilson continue development work. They have several shafts and tunnels, and have taken out some lead ore.

At the Boston and Montana, sinking continues at the West Colusa. At the 300, two crosscuts south are in good second-class ore. In all probability the ledge will be 150 feet wide from foot to hanging, as already each crosscut is over 100 feet. Crosscutting and drifting are being pushed at 400. At the 500 repairing is being done. At the 800 crosscutting continues toward the hanging.——Since the organization of the Monitor Co., it has been decided to sink a 500-foot shaft on the property. The Monitor is in Park Canyon, and although there are many promising properties there, copper ore rich enough to make a paying proposition has never been found.—— The Butte *Miner* says it is stated concerning the Boston and Montana and Montana Ore Purchasing Co. affairs, that there has been a good deal of talk in New York and Boston about a settlement of the differences of the two corporations by a large cash offer for all the Heinze holdings in Butte. It is stated on good authority that several propositions have been made to Mr. Heinze by the representatives of the Boston and Montana and Butte and Boston Co's., but up to this time no offer to purchase has been considered. —— The Basin *Progress* says that at the Ruby mine the mill has been increased to a capacity of sixty tons per day, and yet it is not large enough to handle the ore that can be produced from the mine, and at this time the ore bins and chutes are all full of ore until they don't know what to do with it. With the mine in this condition it is but natural to suppose that the company will shortly make further additions to the mill, giving it a sufficient capacity to handle the output of the mine. A strike was made a few days ago of a chute of rich ore 15 feet wide.——At the Bon Accord placers near Dillon the huge dredge boat of the Bon Accord Co is being rushed as rapidly as mechanics can put the machinery together, and it is expected that by the first of June the machine will be in operation. It is claimed that the Bon Accord will be the largest gold dredging plant in America and is a departure from the plans used in the construction of the dredge boats near Bannack.

H. J. Reiling and F. Pete are at Bannack from Salmon City, where the former bought the placer ground of McNutt on Moose creek, twenty-five miles from Salmon City. He is going to build a boat there this summer. The amount of ground bought is 300 acres and the amount paid $175,000. He went to Bannack to look over some of the Cooper ground, which has been sold to a Chicago company. They expect to build a dredge boat there this summer.——Machinery for a fifty-ton concentrator has been purchased by the owners of the Daisy mine at Cooke, says the Red Lodge *Picket*, and will be freighted in from Cinnabar early in June. The upraise in the mine connecting the two tunnels has been completed and the miners temporarily laid off. Enough ore has been blocked out in the mine to keep the concentrator running four years. As soon as the concentrator is erected, a force of sixty men will be kept at work by the Daisy Co.

SOUTH DAKOTA.

The Wasp No. 2, near Deadwood, is blocking out good ore and shipments will be steady through the year.——The Little Blue Fraction is developing into a good property.

The Golden Crest group, near Deadwood, made a strike of ore carrying gold and silver, with sufficient galena for smelting.——Work on the Gilt Edge continues successfully. They are taking out fifteen tons of ore daily that runs $40 per ton.

WYOMING.

G. Layton, Supt. of the Carissa mine at South Pass, has discovered some ores—a hard, flint-like quartz of bluish cast, impregnated with free gold—which presents a striking resemblance to the gangue that prevails on the mother lode in California. The shaft on the Carissa has attained a depth of 185 feet. The vein at that depth is 6 feet and shows an average of over $20 in gold.

J. B. Conn has fourteen men on the Clark's Fork placer mines near Landers.——The Empire State mine has resumed operations.—— C. M. Louther & Co. of Boston constitute the Lower Douglas Creek Placer M. Co., near Laramie, and will probably put in mining machinery, including a dredger and a hydraulic elevator. The tract comprises 800 acres, of which 400 acres will probably run from 15 to 60 cents per cubic yard, with a depth of 10 feet to bedrock.

H. J. Van Dusen has filed a bond for $10,000 for the purchase of J. Edmunson's copper and cobalt mine near Tie Siding, in six months. The purchase price is $35,000.

COLORADO.

The Ironclad mine, Cripple Creek, has been secured under a five years' lease by H. A. Von Hemert, who started work on the property. The mine has been closed down for six months because the owners failed to make the property pay expenses. The shaft is down

over 400 feet, and the ore chute has been worked out above the 300 level. It is the intention of the new lessees to continue the shaft to a depth of 1000 feet and run drifts and crosscuts at every 100 feet below the 400 point. The mine has been among the list of shippers for four years and some rich ore has been taken out. One carload that was mined at the 200-foot level averaged a little better than $300 per ton, divided almost equally in value between gold and silver.—The Engineer, owned by the Currency Co., is being worked under lease. They have made several small shipments that paid expenses. At a depth of 60 feet the pay streak is 6 inches and assays without sorting from $35 to $50 per ton.—The shaft on the Londonderry is down 300 feet and it is understood that there is a streak of pay ore at this point.—Johnstone & Co., leasing on the Gold Sovereign, on the west slope of Bull hill, have started sinking for a new level. The lease is making regular shipments.——G. D. Johnstone has secured a lease on a portion of the Ingham on Raven hill and is to sink a shaft 200 feet. The block of ground he has secured is known to contain a rich ore chute.—The Midland Terminal has completed its spur and ore scales to the Elkton mine, and the output will be increased from 60 to 90 tons per day. Assays are obtained on picked samples of the ore encountered in sinking the shaft that run better than 100 ounces. Samples on 12 inches of the ore have been obtained that show a value of $1000 per ton.—The Lindsay lease on the Arequa townsite made a shipment of three carloads that it is believed will run from four to five ounces per ton. This came from the 165-foot level and shows sylvanite in quantities. The chute has been drifted on about 20 feet, and if it holds out 30 feet more in the drift there is no doubt but that the Chicago people who are working it under a $125,000 bond will become the owners of the block of ground the second day of July.——The Pence-Miller G. P. M. Co. at Breckenridge has seventy men at work on the new ditch for the operation of the first plant of hydraulic placer mining machinery which will be put in at the mouth of French gulch. The ditch is to be several miles long, 11 feet wide on top and 6 feet wide on the bottom, and is intended to carry a body of water 2½ feet deep. This season plants will be established at the mouth of French gulch, near Breckenridge, and on the Golden Crown placer. At the latter place a bedrock shaft was sunk several years ago by C. L. Westerman and the gravel was found to be rich in coarse gold. The great inflow of water at the time prevented profitable operation through the drifts along the bedrock. When the plants are in full operation it is expected that they will handle 12,000 yards of gravel for twenty-four hours.——T. McDonald is unwatering the old World's Fair shaft near Cripple Creek under bond and lease.——The report that the Ingham Co had ceased working was incorrect.——The Dead Pine is again making regular shipments, the new level having reopened the chute after several weeks of prospecting.——The Village Belle at Eldora sustains its reputation as a producer of high-grade ore from its tellurium pay streak, and arrangements are making for putting in new machinery and sinking a new shaft.——The Revenge group are taking out high-grade ore.——The Ready Cash are pushing their tunnels through a 10-foot ledge of ore.——The Ironside has a force at work on ore running $35. The Cora O. was recently sold for $10,000.

The new 150-ton mill of the Mollie Gibson and Argentum-J. at Aspen is completed and running successfully. The Mollie ore demands one-third of the capacity, six tables, and the Artentum-J. two-thirds, or twelve tables. Neither company, says the *Record*, is outputting any ore, the forces being practically laid off, but the mill is kept busy upon the mass of low-grades that have been piled on the dumps for the past ten years, and which can now for the first time be profitably handled. The ratio of concentration is ten tons into one, running high in lead. The A.-J. alone has 14,000 tons on the dump. The Mollie has been leased in blocks and is being developed by lessees.——The new concentrator built by the Smuggler people is not entirely completed. It is larger than the old one and contains valuable improvements. The Smuggler is working from 150 to 200 men, and in addition to the large amount of ore on hand is producing enough ore to keep the mill busy.——The Della S., Regent and Bushwhacker are worked by lessees with the usual result. Some are doing well.——The Durant, Compromise and Millinee are working some men on company account and are also leasing ground in good paying ore.——At the camp of Independence the Hunter Pass mines are making an output to keep the new mill busy now in course of erection, to be completed by September 1st. A force of 120 men is employed.

With the completion of the switches from the Midland Terminal to the Elkton at Cripple Creek the output of the latter is expected to be increased from sixty to ninety tons a day. Late assays from picked samples run over 100 ounces in gold to the ton.—Three-twentieths of the Bonnie Nelson have been sold for $7000.——Twenty men are at work in the Uintah tunnel and the work of crosscutting in the Big Banta for the Uintah ore shoot is being crowded day and night.——Dean & Cain have opened on the Deadwood the same blanket vein from which the lessees on the Pauper and other portions of the Deadwood have been making steady shipments for the past eight months. At the point entered the blanket holds an average of 2 feet of ore that ships at $30 for second and $80 for first grade.——Sixteen and a half tons of ore shipped from the Wirth mine at Ward ran 5.21 ounces in gold and 1.28 ounces in silver. There will be another carload of smelting ore shipped this week.——The Sedalia at Leadville is producing fifty tons per day of mineral with twenty-eight men This includes the whole payroll.——The Smuggler-Union stamp mill at Pandora is treating 200 tons of ore per day on an average. From six to eight tons of the mineral are concentrated into one and from two to three carloads of concentrates, worth from $60 to $80 per ton, are the daily product.——A shipment of ten tons of ore from the Mediterranean group at Rico to the concentrator has been completed. The ore body averages from 2 to 7 feet in thickness. Every ore bin of the concentrator is filled with ore. The capacity of the mill will be fifty tons per day.

The Tom Boy is again working on the true lead. The value of the ore now being milled is not made public, but it is said that some of it assayed $500. Development is being pushed to open up enough ground to keep the mills, with their 200 tons a day daily capacity, steadily employed.——The mills at Empire are running night and day.——A promising strike of sulphide ore has been made near Dillon.——The Cripple Creek output has been reduced somewhat by the bad condition of the roads.—It is estimated that the Leadville gold properties are outputting 750 tons a day.——The Concrete mine of Gilpin county employs sixty men, who are taking out over one ton a day per man of free milling ore.——Mgr. Newell of the Ute & Ulay reports Lake City showing greater activity than ever before at this season of the year. He says the Golden Fleece is working full force, and 100 men are working on the Ute & Ulay.—The Taylor park placer near Tin Cup is working sixty men. The flume is 2500 feet long and preparations are being made for extensive work.——J. H. Sinclair is shipping ore from the Forest Hill, the richness of which may be understood when it is considered that it is hauled from Forest Hill to St. Elmo station at a cost of $20 per ton.——A new placer company, represented by Garden Bros. of Illinois, has let a contract for a four-mile ditch from Willow creek, to be 6 feet wide and 3 feet deep, to be completed within six weeks. The company proposes to push placer work.

Ward *Miner*: The Columbia, Nelson and Plow Boy mines, near Ward, have been sold, the total aggregating $105,000. Machinery for development is steadily coming in, and nine of the leading mines—the Utica, Star, Wirth, B. & M., Newmarket, Adit-Dew Drop, Giles, Sullivan, U. P., Ward-Rose and Boulder County—are in good ore and heavy shipments await the coming of the railroad, but a few days distant. The Columbia mine passed into the hands of one of the largest mining companies in the State. Fifty thousand dollars is the figure reported. It is historically the second greatest mine in the district, second only in interest to the Ni Wot, being the original discovery of the camp, made by Cy Deardorff thirty-eight years ago. From a shallow development it has produced more than $350,000 in gold. Following the Columbia sale comes the Nelson. The price paid for the property is $32,500. With such development as is proposed for it by the new owners it will soon be numbered among the big propositions of the district. The shaft is 370 feet deep, and there are only about 800 feet of levels, yet the known production of the Nelson exceeds $40,000. The smelting ore runs from $60 to $85 per ton in gold in carload lots. The sale of the Plow Boy group by M. Finnerty was made to the same company that purchased the Nelson mine. The amount to be paid for the group is $25,000, with a small cash payment down and the balance in installments.

The Colorado smelters obtain the larger part of their needed lead ore from the Coeur d'Alene mines of Idaho. On this account, says the *Mining Industry Review*, the question of freight rates from Idaho to different smelting points has a very close relation to the debit and credit sides of profit and loss account. In the past the rates have been fixed to the apparent satisfaction of the smelters, but last week a change went into effect which appears to be strongly in favor of Leadville as a smelting point and against Denver and Pueblo. This change gives Leadville a rate from Idaho of $2 per ton less than the rate to Denver. As Leadville gets its iron from home, while Denver pays $2 50 per ton freight on it, it is apparent that the advantage is largely in Leadville's favor.

MINNESOTA.

The Stella mine, near Rainy Lake, has a 5-foot vein of fair grade gold ore.

ONTARIO.

The April cleanup of the Mikado mine near Rat Portage was $8000.

NEW MEXICO.

The Silver City *Enterprise* says that the Copper Queen mine and mill at Cooney were closed down on the 12th. The property has not paid. C T. Mixer, from Ishpeming, Mich., is examining the property and upon his report will depend largely whether the mine and mill will be operated in the near future or work indefinitely suspended.—At Mogollon R. Thomas has men at work upon the Deadwood mine and will soon be ready to run the Deep Down mill again. The last mill-run from this property paid good profits.——The Confidence keeps about seventy miners employed taking out ore which supplies the 30-stamp mill at Whitewater. The new pipe line to supply water power for the mill and run the motors is nearly completed.—The work of retimbering the shaft and drifts upon the Little Fanny mine has been completed and operations upon the property suspended indefinitely. The work was to secure the mine against a cave-in resulting from the idleness of the mine for the last two years. Its long-continued suspension of operations is a puzzle to every one but the insiders.——On the 11th the Hanover mine suspended operations, throwing fifty men out of employment. This property has produced fifty tons per day of copper ore the past eighteen months. The property is owned by Catron & Simpson. N. S. Berray, representative for Mr. Simpson, has had charge of the property under lease from Catron working the mine for Simpson. The lease from Mr. Catron expires on June 1st, after which time a farther extension of the lease could not be obtained, hence the suspension of operations.

ARIZONA.

Denver men have purchased the tailings of the Mammoth mine, near Tucson, amounting to about 180,000 tons, and will erect machinery for working them. They have a cyanide process. They will employ forty men. The Mammoth will turn out over 100 tons of tailings a day.——The Kingman G. M. Co. has been organized to develop properties near Cedar, which are said to have enough ore in sight to justify the erection of a 10-stamp mill.——C. Toohey of Phœnix has begun hauling 2500 tons of ore to the mill of the Standard group, in Santa Maria section.——In the Santa Maria district, Yavapai county, it is stated that the cyanide plant of the Waters Co. is in operation and a large percentage of gold saved. A contract has been let for the driving of a 400-foot tunnel on this property, and 100 feet has been completed.——It is said in Yuma that in the Castle Dome property, long since abandoned as unprofitable, now being operated by J. D. Thompson, a body of ore of good values has been opened.——The Great Republic mine near Globe, at a depth of 100 feet, has a 30-foot ledge carrying copper and gold.——Development work on the Franco-American M. Co.'s works, near Tucson, continues with satisfactory results.——At Chittenden the Hardshell mine continues producing good ore.——The Three R mine has been bonded and development work will be continued.——The Bisbee *Orb* says that the development work on the three tunnels on the 600-foot level of the Copper King is progressing rapidly and everything looks favorable. The ore body is said to be large. There is available cash in the treasury to push development work for several years, besides erecting the proposed 100-ton smelter when needed.——The Mojave county *Miner* says Santa Fe Pacific railroad officials are considering a proposition for a $5-rate on low grade ores. The rate will go into effect before June 1st, and ought to be the means of moving thousands of tons of low grade ores smelterward.

W. P. Hamlyn has purchased a group of twelve mining claims near Prescott for $22,500.——Development on the Gold Standard at Santa Maria is progressing.——On the Purple Rose an ore body 14 feet wide has been found.——The Turnbaugh and Pocahontas are both pushing work.——At the Red Rock mine the vein is 18 inches wide, assaying $60 per ton gold. The property is being operated by M. Foe of San Francisco.

The Elkhart shaft, near Chloride, has been sunk 315 feet and a heavily timbered station is being put in at the 300-foot level. Sinking will continue to the 400-foot level. About 40,000 tons of ore are blocked out, and the large concentrating mill is running part time, producing very good grades of shipping concentrates, and a large quantity of pyritous headings, which are being held on the ground, awaiting the erection of a matting plant.——The Tennessee, on the same vein as the Elkhart, and the Schuylkill lying between them, have opened good bodies of similar ore. This vein is large and frequently shows chimneys of galena as much as 15 feet in width. The work done on the three properties aggregates nearly 4500 feet, of which 2670 feet is on the Elkhart property. The Schuylkill shaft is down 220 feet, and the shaft on the Tennessee is sunk 195 feet.——The Minnesota mine, owned by J. Burry and the Baldwin estate, yields high-grade ore.——An Eastern company is working the Merrimac, from which high-grade ore has come.——The Altata has been revived. This property carries copper ore.——The ore of the Klondike mine, in Mojave county, is in the nature of spar, but the gold being free admits of amalgamation on plates instead of making it necessary to submit to the more expensive panning method in vogue in other parts of the county.——The mines of Cedar district, in Mojave county, chief among which is the Belle McElroy, are showing up satisfactorily. The mine named has a 5-stamp mill on it, the gold being susceptible to treatment by amalgamation and concentration. The 180-foot shaft is in ore all the way, which exists in larger quantity and of better quality in the bottom than elsewhere.

LOWER CALIFORNIA.

Californian: The development of the sulphur mines on the desert near Ensenada is progressing. Considerable quantities of the ore have been shipped to their refining plant at Ventura, and it is now proposed to establish a refinery at the mines. The surveys on the proposed railroads have been completed to Yuma in one direction, and the engineers are now at work on the coast route. There is practically an unlimited amount of the ore, which is found in deposits, or rather vertical shoots, and at present they are blasting in the surface workings. With depth, however, their method of excavating must be changed, owing to the sulphurous fumes which fill the shaft.

MEXICO.

A St. Louis company is working on the Rio Aros, near Sahuaripa, and has a 5-foot ledge running an ounce in gold and forty-seven to fifty ounces in silver. It has a shaft 75 feet. Reduction machinery will be erected. J. M. Beauchamp is Gen. Mgr.——The Alamos mine has sent to the Culiacan mint sixty-nine bars of silver valued at $64,226 64 silver and $476.87 gold.

Near La Colorado, P. Negro is working La Patria mine, as much as the dearth of water will permit. With a small mill, which he runs forty-eight hours twice a month, he gets $4000 in gold.——Near Minas Prietas development on the property of the Yakui Co. is progressing. A ledge of $35 gold ore has been discovered.——On the Guillermina mine, at a depth of 30 feet, a large ledge of $10 ore has been found.

NEW ZEALAND.

Minister of Mines A. J. Cadman officially announces from Wellington that "a bonus of fourpence per pound will be paid on the production of the first 100,000 pounds weight of good, marketable, retorted quicksilver, free from all impurities, from any mine in New Zealand, on conditions that at least one-third of the quantity is produced on or before the 31st March, 1900, and the remaining two-thirds on or before the 31st March, 1901. No bonus will be payable until the whole of the 100,000 pounds of quicksilver has been produced as stipulated to the satisfaction of an officer to be appointed by the Minister of Mines, and on whose certificate alone the bonus will be paid."

TAKE THE ... "GOLD PICK LINE"

For St. Michaels, Dawson City or Kotzebue Sound.

STEAMERS SAIL AS FOLLOWS:

FOR ST. MICHAELS AND DAWSON CITY—From San Francisco: May 25, June 1, July 1, August 1 and September 1.
From Seattle: June 5, July 5, August 5 and September 5.

FOR KOTZEBUE SOUND—From San Francisco by Steamer: May 28.
From Seattle by Steamer: June 5.

Bear in mind the fact that we have the finest steamers in the service, set the finest table, pay the greatest attention to the health and comfort of passengers, and that our steamboats have all been built this year and are especially adapted to the river service.

JOHNSON-LOCKE MERCANTILE COMPANY, Sole Agents, 609 MARKET STREET, SAN FRANCISCO
112 YESLER WAY, SEATTLE.

Coast Industrial Notes.

—May rains have greatly aided California miners and farmers and a fair year's yield is now looked for.

—The Union Sugar Co. of San Francisco is building a $500,000 factory at Santa Maria, Cal., where articles of incorporation have been filed.

—The well of the Central Oil Co., Whittier, Cal., has commenced to flow at the depth of 1065 feet. The company has a new steel tank of 20,000 barrels capacity at Los Nietos.

—Work on the extension of the Palouse branch of the Northern Pacific Railroad is being pushed ahead, 150 men being employed on the grading work. Trains will be running into Lewiston, Idaho, by July 1st.

—The Hemman Construction Co. of St. Louis, Mo., has the contract to put in an $8,000,000 sewerage system in the City of Mexico. The services of 1000 laborers for four years will be required.

—Washington, D. C., authorities decide that California marble can be the material used in the new San Francisco postoffice. Bids for iron work thereon, aggregating $700,000, will be opened June 23rd.

—The Stockton and Tuolumne County Railroad will be sixty miles long from Stockton, Cal., through Copperopolis, Angels Camp and Sonora to Summerville. Surveys have reached Copperopolis. There are rails and ties for twelve miles of track on the ground.

—Coast trade with Siberia is growing. Last year three vessels were sufficient to carry all the freight offering. During the last two months the barkentines Addenda and J. M. Griffeths, the barks Edward, May and Wilna and the steamers Taifu and Ailsa Craig have all left San Francisco for the Amoor river. Their cargoes mainly consisted of flour, salt, lumber and general merchandise.

—In the Sierra Nevada foothills in Placer and Nevada counties, Cal., the Towle Bros. Co. has large portable engines dragging logs up and down hill and loading them onto trucks, which are drawn by steam wagons down to the railroad. The company has built good roads, of easy grade, around the various points along the ridge, and the steam wagons only come into the county road in two or three places. When they do they blow their whistles to warn travelers.

—A new capitol building for the Mexican Government, costing $5,000,000 in Mexican money, is to be erected in the City of Mexico. The building will be 330 feet square and surmounted by a large dome of imposing design, supported by thirty-two columns. Competition for the award of the design was opened about a year ago and closed last November, fifty-two competitors from all parts of Europe and United States taking part. The first prize of $15,000 has been awarded to A. Boari, a Chicago architect.

—Contracts for the complete construction of the railway to be operated from Skaguay to Lake Bennett and eventually to the Yukon river were awarded in Seattle this week. The managing head of the construction of the railroad is E. C. Hawkins, of Denver, Col. Under the plans adopted the road is to be built over the White Pass to a point on Lake Bennett, forty miles, from there it is the intention to push the work of construction to Fort Selkirk, nearly 400 miles from Skaguay. The men interested in the White Pass Railway Co. claim that they have matters arranged in such a way with the Governments of the United States and Canada, that the most feasible route can be adopted.

—The directors of the Mexican Land, Navigation and Railway Co. have decided to begin work at once on the construction of the railway from Paso del Rio de San Juan, in the State of Vera Cruz, to a point on the Tehuantepec railroad, and to place orders in the United States and Great Britain for the necessary material. There is one peculiarity of the trade conditions of Mexico which teaches an important lesson. In all the northern and border States it may be said that the United States practically monopolizes the trade; further south England and Germany claim fully one-half, while in the southern part of the country England and Germany divide between 80 and 90 per cent of the whole trade.

—Frank L. Brown, of the Washburn-Moen Co., a director of the Manufacturers and Producers' Association, has a telegram from the Transcontinental Freight Conference at Milwaukee that advances have been made on west-bound car rates and on differentials, but that rates on east-bound freights have not been advanced, only changed. The new and old rates in five classes in less than carload lots for each 100 pounds are as follows: Class 1, new $4, old $2.40; class 2, new $2.60, old $2.15; class 3, new $2.50, old $2; class 4, new $1.90, old $1.70; class 5, new $1.60, old $1.65. For carload lots—Class 1, new and old $1.60; class 2, new $1.25, old $1.10; classes 3, 4 and 5, new and old unchanged, are respectively $1 and 95 cents.

—Congress will soon be called upon to decide the question of building a canal connecting the Atlantic and Pacific oceans. Chairman Davis of the Senate Foreign Relations Committee says: "The need for a connection between the Atlantic and Pacific cannot be questioned. Our interests demand it. With a canal between the two oceans we would have nothing to fear from an attack on our Pacific coast. With a liberal appropriation, say $100,000,000, a canal could be constructed through Nicaragua that would be of value to the United States Government for all time to come." When the report of the Walker Board upon the feasibility of the Nicaragua canal route comes to Congress, it will be one of the strongest documents in the history of American endeavor to secure the interoceanic waterway. Admiral Walker says that no more striking lesson of the necessity for such means of communication between the oceans could have been given than in the long trip of the Oregon. Admiral Walker will dwell at length upon this phase of the subject, and will point out the advisability of beginning work upon the canal at once.

—Since war was formally declared against Spain the United States Government has bought over 12,000 tons of British Columbia coal. The Government has had no trouble in getting this coal, although it is a contraband of war, and England as a neutral nation could not allow it to be taken from her mines. By purchasing the coal from a third party this stumbling block has been surmounted. The coal purchased by the Government is to be disposed of in several ways. The U. S. monitor Monadnock, at Port Angeles, Wash., will use 1500 tons. Vessels conveying coal to Port Orchard, Wash., are also on an 8000-ton contract. The ship Henry Villard is at Comox, B. C., loading 3000 tons for Honolulu, where it will pass into the hands of the Government. The Villard is doubtless the first of a fleet of sailing vessels that will be sent to Honolulu with coal for the Government. The coal is to be put ashore on the island and kept for the use of war vessels and transports on the run to Manila. It will undoubtedly be British Columbia coal that will be purchased. Unless the Government kept a supply on the islands it would often be impossible to get coal. Until the last liner arrived from Australia there was a great shortage at Honolulu. E. E. Caine of Seattle says he has sold the bark Enoch Talbot to the United States Government, with her cargo of 2300 tons of Comox coal The purchase was made by Commander Green, of the Port Orchard navy yard, for the Government. The Talbot is to be kept at the drydock as a coal ship. It is the intention of the Government to keep 3000 tons of British Columbia coal on hand. The question: "Why does not the Government buy American coal when a quality almost, if not quite, as good can be purchased for less money?" has never been answered. The Blue Canyon Co. of Whatcom, Wash., has coal that stands a navy test as well as Comox, and they have plenty of it for sale.

Personal.

T. P. Slessinger is Mgr. Kohinoor mines, Leadville, Colo.

Wm. Van Slooten, a New York mining engineer, is in San Francisco.

W. G. Martin becomes Gen. Mgr. Etta M. and M. Co., Prescott, Ariz.

W. G. Boyle becomes Supt. Golden Link M. and S. Co. Creede, Colo.

F. Searles, the mining attorney, Nevada City, Cal, is in San Francisco.

E. K. Naneville has succeeded J. A. Veatch as Supt. Fern mine, Ymir, B. C.

G. Stayton, Supt. Republican mine, Jacksonville, Cal., is in San Francisco.

G. Mainhart, Supt. Omaha Con. M. Co., Grass Valley, Cal., is in San Francisco.

C. L. Lang, Supt. Star mine, Sonora, Cal., has returned home from San Francisco.

F. F. Coffin, Supt. Griffith Con. mine, Diamond Springs, Cal., is in San Francisco.

J. M. Owen succeeds D. F. McCarthy as Supt. Garfield Con., Cripple Creek, Colo.

J. C. Diamond, managing owner Limpensel mine, Placerville, Cal., is in San Francisco.

G. W. Grayson of San Francisco is visiting his Shirttail Mountain mines near Kingman, Ariz.

R. Walker of Grass Valley, Cal., becomes associate Supt. Tom Boy mine, Telluride, Colo.

E. H. Barton, a mine owner from Sonora, Cal., has returned to the mine from San Francisco.

G. E. Hoyt, managing owner Gopher M. Co., Shasta, Cal., has returned home from San Francisco.

A. Moore, Supt. Clay Bank Tunnel mine, La Porte, Cal., has returned home from San Francisco.

J. A. Veatch, Supt. Fern mine, Nelson, B. C., is examining mining properties at Forbestown, Cal.

M. F. Motherwell, Supt. Three Sisters mine, French Gulch, Cal., has returned to the mine from San Francisco.

H. K. Shockley, Supt. Phœnix M. &. I. Co., Nevada City, Cal., is in San Francisco, en route to Cincinnati, Ohio.

Samuel J. Hendy, of the Joshua Hendy Machine Works, left San Francisco last Wednesday on an Eastern business trip.

Covington Johnson of San Francisco is examining Rossland, B. C., mining property with Geo. Crocker of the Southern Pacific.

D. H. Jackson, Supt. Ida Mitchell and Gold Bug mines, Placerville, Cal., has returned home from a prolonged stay at Fresno.

Herman A. Keller, metallurgist, of San Francisco, has sailed for South America on professional business, to be absent four months.

Philip Rearden has resigned the superintendency of the Sulphur Creek, Cal., mines, and will be succeeded by Vice-Pres. Hay of the company.

Capt. Richard A. Parker of the London Exploration Co. has returned to San Francisco from an examination of mining property at Rossland, B. C.

Obituary.

Joel B. Low, an old and respected mining engineer, died at his residence in San Francisco on the 21st inst.

Recently Declared Mining Dividends.

Jersey Leasing Co., Colorado, $8000; payable June 1.

Gold Coin Co., Colorado, 1 cent per share, $10,000; May 25.

Modoc, Colorado, 2 cents per share, $10,000; payable June 1.

Cariboo, British Columbia, $16,000; May 20.

Idaho, British Columbia, $24,000; May 21.

Mammoth, Utah, 5 cents per share, $20,000; payable June 1.

Highland M. Co., South Dakota, $20,000; May 24.

N. Y. & Honduras Rosario M. Co., $15,000; May 20.

Boston & Montana Copper M. Co., $450,000; May 20; $7,625,000 to date.

Recent California Mining Incorporations.

Note.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Wave or Current Motors.—Gustav Lofgren, Newark, Cal. No. 604,211. Dated May 17, 1898. This invention relates to a novel means for applying both the forward and return waves or the force of a current running continuously in one direction for the propulsion of machinery. It consists essentially of a series of vertically adjustable shafts having paddles or floats fixed to them, diagonally disposed sluices, the sides of which are so arranged with reference to the floats that the influx of water in one direction will strike the floats upon one side of the central shaft and cause them to rotate, and the return or reflex wave or current will be so directed as to strike the floats upon the opposite sides and cause them to rotate continuously in the same direction. This is effected by an arrangement of diagonally disposed channels or chutes so fixed with relation to the wheels and the line of movement of the waves that the inflowing wave is directed against one side of the wheel and the outflowing wave against the opposite side, so that an approximately continuous motion in one direction is kept up. In conjunction with this transmitting mechanism is fixed to the upper ends of the shafts, connecting them with a countershaft, through which the power is transmitted.

Books Received.

"*Outline of a Short Course in Qualitative Chemical Analysis, Arranged for Students in the Colleges of Science of the University of California:*" By W. J. Sharwood, Instructor in Chemistry; revised edition, 1898; octavo, pp. 142; a practical work of technical value, sold by the Students' Co-operative Association, Berkeley, Cal., or sent postpaid from this office; price, $1.25.

The New York *Scientific American's* special Navy supplement of April 30 is an unusually fine number, giving a good history of the American Navy for the past fifteen years and illustrating and technically describing the various classes of war vessels, with statistics, and a colored map of Cuba.

Commercial Paragraphs.

The Lunkenheimer Co. of Cincinnati, Ohio, is issuing for the use of engineers a simple and practical chart giving diagrams of a new method of analyzing the movement of the slide valve. Every engineer should have one, as its use will enable him to thoroughly understand the relation between the slide valve and crank movements without the aid of any intricate mathematical calculations whatever. Sent free upon request of any bona fide engineer.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of references. Address J. D., Mining and Scientific Press.

Mining Partner Wanted

With Capital to Develop One of the Largest and Richest Mines in Nevada County, California.

A rare opportunity for right party. There is millions in it. For full particulars, please address S. B. FOWLER, M. E., Grass Valley, Nevada County, California.

Position Wanted by Millman.

Am at present foreman of prominent gold mining company's mill; desire position in central or southern part of California; satisfactory references furnished; am thorough at concentrators, either Frue, Triumph or Norbom; have also good references as assayer, all first-class and reliable. State salary and particulars. Address Gold Millman, Box B, Mining and Scientific Press office, San Francisco.

HONDURAS CONCESSION.

WANTED,

PARTY to take an interest and the MANAGEMENT of a

PLACER CONCESSION

IN HONDURAS, same yielding $5.00 PER YARD. Property will stand a most rigid examination, and the best of inducements offered. Address

T. E. ROWAN,
Office Nos. 4 and 5 Bryson Block,
LOS ANGELES.

COPPER.

SOUTH BISBEE COPPER MINING and TOWNSITE IMPROVEMENT CO.

Capital Stock, $5,000,000.
NON-ASSESSABLE.

A limited number of shares of the treasury stock are offered at TWENTY CENTS per share.

Applications for stock or copy of the prospectus can be had on application at company's office, No. 4 Bryson Block, Los Angeles, where samples of the ore can be seen and full information relative to the property obtained. T. E. ROWAN, Treasurer, or, H. W. LEWIS, Secretary.

For Sale Cheap.

10,000 FEET GOOD 18-INCH STEEL PIPE,

IN USE ON SURFACE IN AMADOR COUNTY.

Address:
FRANK H. JACKSON,
105 South Broadway,
LOS ANGELES, CALIFORNIA.

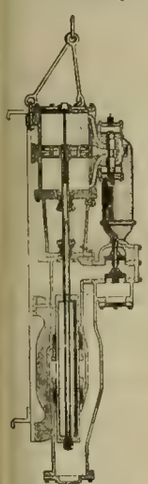
A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

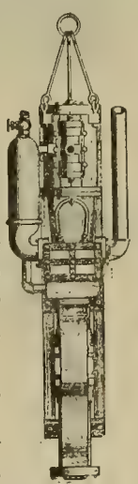
"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.



The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.



Estimates made for complete Steam Freighting Outfits. Address

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

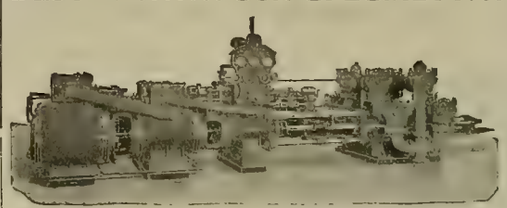
— MANUFACTURED BY —
THE RISDON IRON & LOCOMOTIVE WORKS,
SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.



Colorado's Mining Industry.

There have been a number of interesting and instructive pamphlets issued on this subject by the U. P. D. & G. Ry. and the South Park Line, Colorado's progressive railroads, which reach the principal mining centers of this vast mineral section. They are all carefully and conservatively prepared and will be mailed upon receipt of request and necessary postage. The various publications are as follows:

La Belle Gold Fields, 2c.
Gunnison Gold Belt, 2c.
Hints to Prospectors, 2c.
Ward Mining District, 1c.
Pine Creek, 1c.
Puma, 1c.
Breckenridge Gold Belt, 1c.

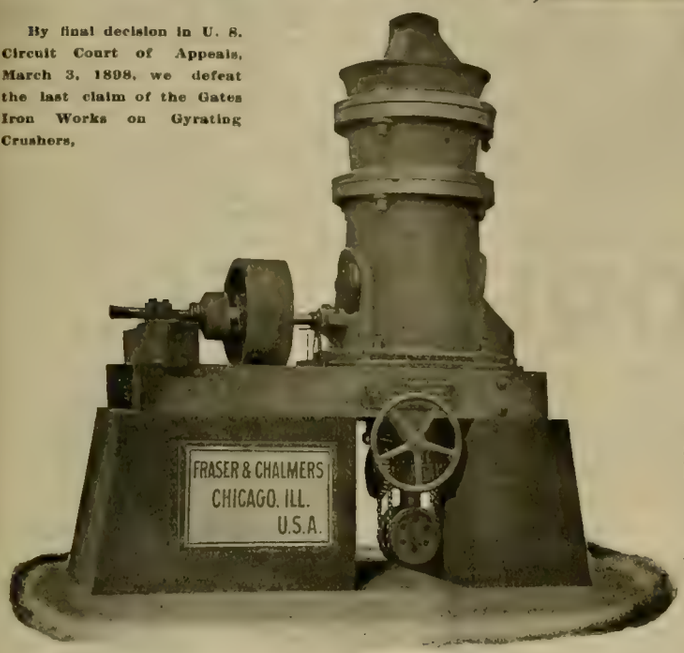
Just Listen—Reliable Common Sense Steel Whim, price reduced to $100. Steam Hoisters, $300 and up; hand hoisters $30; steel ore buckets all prices; prospectors' stamp mills $300. A 10-stamp mill, new, 850 lb. stamps, high mortars, latest improved. Only $800.



Ores tested and amalgamation and concentration mills built to fit the ore and guaranteed to save what we say. Coal Mine equipments, Screens, Jigs, Tramways, Arastors, Chillian Mills, Ore Sacks, etc. Cornish Rolls, 12x20, weight 6,000 lbs., price $350; Feeders, Bumping Tables; Blake Crushers, 7x10, weight 8,100 lbs, only $250. Our 100 page illustrated catalogue FREE.

FRASER & CHALMERS, 155 Fulton St., Chicago, Ill.

By final decision in U. S. Circuit Court of Appeals, March 3, 1898, we defeat the last claim of the Gates Iron Works on Gyrating Crushers,

MINING MACHINERY.

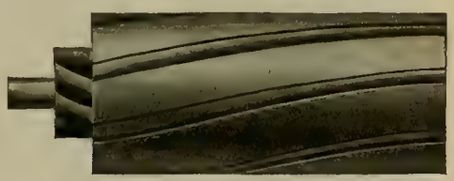
Be Sure You Get

THE GENUINE FRUE VANNER.

SUPERIOR TO ALL IMITATIONS.

You do not know what is best in CRUSHERS unless you have used our

Comet Adjustable.



It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

FRASER & CHALMERS, General Agents for Improved GREEN Blowers.

See those wires -- how they interlock? Note the smooth surface also. No displacement of wires in any event. Gives three times the service of other cables, and adds correspondingly to the life of the rolling stock.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The Pelton Water Wheel Company

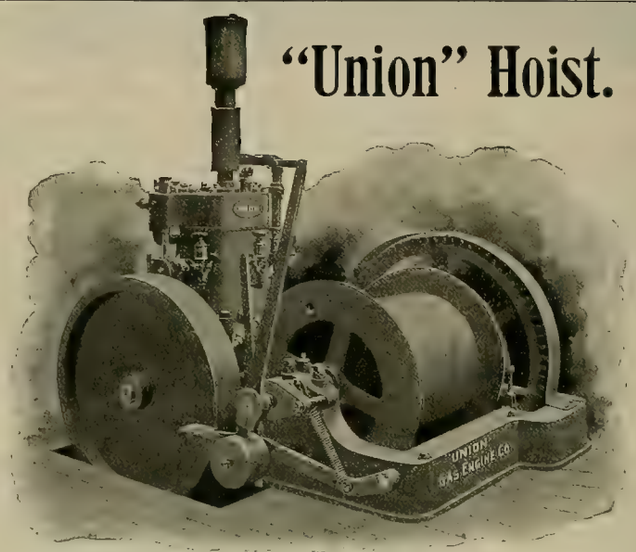
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, May 26, 1898.

Just now coal is king, and wheat is prime minister. Europe must have wheat; warships must have coal. In both cases the United States has all the advantages. This fact alone will avert the threatened "European coalition" against this country. Europe can't afford to antagonize the source of supplies. An American embargo would starve Europe.

Business in general shows improvement. Some lines are dull, principally those requiring investments, because of the many new opportunities which war proffers. A good deal of business time is also devoted to consideration of war news and its attendant requirements.

In Washington it is figured that if the war continues for a year it will involve an expenditure of over $400,000,000. The appropriations already made, or estimated as necessary for that period, are as follows: For the army, estimated, $165,000,000; for the navy, estimated, $75,000,000; emergencies defense fund, appropriated, $50,000,000; army deficiency bill, passed, $25,000,000; naval deficiency bill, pending, $22,000,000; regular army appropriation bill, passed, $23,000,000; naval appropriation bill, passed, $8,000,000; total, $425,000,000.

The optimistic view that Spain will sue for peace as soon as a naval battle is won, and that the war will not last a year, is not shared by men who may be supposed to reflect the views of the Administration. Even should peace be declared in a month or six weeks, the United States will have an expensive and lengthy task before it in establishing a stable government in Cuba and effecting the occupation of the Philippines. There is also a growing feeling that Spain's fleet will not risk a combat with the American navy, and thus the war will be indefinitely prolonged.

The metal market is generally active. Quicksilver is still on the up grade. Local quotations to-day are $42.50, export $37.50 and $38. London reports an advance. An Oregon correspondent writes: "In Douglas Co., this State, there are immense deposits of mercury ores, but of very low grade," and suggests therewith the importance of right concentration methods.

Exports of copper, as per United States Government figures, just issued, were as follows, for nine months ending March 31:

Copper matte, tons—	*1898.*
To United Kingdom	4,089
Germany	2
Other countries	1,738
Total matte	5,829
Copper ingots, bars, etc.—	*Pounds.*
To United Kingdom	47,307,818
France	50,841,860
Germany	21,862,121
Other Europe	88,492,761
British North America	730,736
Mexico	93,875
Other countries	45,320
Total in ingots, bars, etc	209,174,501

The Government also reports imports of copper during March amounting to 10,114,451 lbs. It is understood that most of this was Boleo copper product, coming here to be re-exported to Europe. It is also understood that these imports when again exported were not included in the regular exports for March, as compiled by the Copper Association.

N. Y. City reports Lake Copper $12 bid and $12.10 asked. Tin higher and firm, $14.80 bid, $14.87½ asked. Spelter quiet, $4.25 bid, $4.30 asked. Lead inactive, $3.60 bid and $3.65 asked. Lead is still quoted at $3.50 by the firm fixing the selling price for miners and smelters in the West.

San Francisco prices are not materially changed from last week's quotations. On Nails, list prices per keg, subject to change without notice, are: No. 20 to 60d, Wire, $2.25; Cut, $2.10; 10 to 20d, Wire, $2.30; Cut, $2.15; 8d, Wire, $2.35; Cut, $2.20; 6 and 7d, Wire, $2.45; Cut, $2.30; 4 and 5d, Wire, $2.55; Cut, $2.40; 3d, Wire, $2.70: Cut, $2.55; 2d, Wire, $2.95; Cut, $2.80. In carload lots, 10c per keg less.

On structural material, Chicago quotations are: Beams and channels up to 15 inches, 1.30@1.35c; 18 to 24 inches, 1.40@1.45c; tees, 1.40 @ 1.45c; angles, 1.20 @ 1.25c; universal plates, 1.30@1.35c.

The Manila blockade occasions continuous advance in cordage. Exports of hemp have ceased at Manila, and there has been an advance in its price of 80 to 90 per cent in the American market and of 100 per cent in London. The stocks of Sisal in this country and abroad are light. It is a substitute for hemp, imported chiefly from Yucatan. That has gone up, too. Jute has advanced about 20 per cent in sympathy with the advances in the other products. Tubbs & Co. quote Manila 9¼c, Sisal 8¾c.

Chemicals are unchanged. In cyanide one ten-ton lot was sold in San Bernardino last week by J. Jeffreys of Ontario at 30.3 c. ℔ lb.

Through the week silver was steady. New York quotes 57¼c, London 26½d, local 57⅝. The silver exports from the Pacific coast during April aggregated $347,353, against $449,210 last year, a decrease of $101,857; for four months the exports were $2,098,832, against $3,726,603 last year, a decrease of $1,627,771. Last week the Bank of England paid 77s 10d per ounce for bar gold. This is believed to have been unprecedented and illustrates the great lengths to which the bank has gone in order to secure specie.

M. CRAFFEY,
Manufacturer of the Celebrated
Smelter Broom,
1554 BLAKE ST.....DENVER, COLO.

Mining Share Market.

SAN FRANCISCO, May 26, 1898.

Margin stocks were largely closed out during the week, but beyond that there was little that could be considered business. Much that was hoped for a year ago has not materialized, and the stock business is practically dead. Next Tuesday the old San Francisco Stock and Exchange Board will extend its business to include dealings in local and Eastern railroad, gas, water, sugar, powder securities, bank and insurance shares, United States, State and municipal bonds. New auxiliary members will also be admitted. The only attention recently attracted to the Brunswick operations is the discontinuance of all Sunday work thereon.

The Sierra Nevada has been doing well since the extraction of ore began from the Riley tunnel, about $19,000 gold having been received therefrom. The bullion yield from the Con. Cal. & Va. ore worked at the Morgan mill shows that 750 tons yielded bullion of the gross assay value of $15,696 30, of which $8366.87 was gold and $7329.43 silver. The yield in bullion per ton was $20.95. The assay value of the ore per battery samples averaged $27 per ton. The assay value of the ore per railroad car samples averaged $31.47 per ton.

STOCKHOLDERS' MEETING.

Notice is hereby given that the regular annual meeting of the NATIONAL CONSOLIDATED MINING COMPANY will be held at the office of the company, 916 Market Street, Rooms 56 and 57, in San Francisco, on MONDAY, the 6th day of June, 1898, at 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may properly come before the meeting.

By order of the Board of Directors.
G. W. FLEISSNER, Secretary.
San Francisco, May 12th, 1898.

Working Capital for Mines.
PACIFIC EXPLORATION COMPANY
Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

—THE—
Oregon Short Line
RAILROAD
AFFORDS THE BEST ROUTE TO THE GREAT NORTHWEST.

THE BEST BOOKS
Are always the CHEAPEST. All the latest and best works on Mining, Metallurgical, Electrical and kindred subjects can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of Standard Mining Works and Scientific Publications.
MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Assessment Notices.

RED CAP MINING COMPANY. LOCATION of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of April 1898, an assessment (No. 3) of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 125 Beale St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 27th day of June, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office 125 Beale St., San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 218 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 5th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—218 Jackson St., San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of June, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 23rd day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—No. 916 Market street, Room 57, San Francisco, California.

LEON GOLD MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

Lunkenheimer's "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.

Made with Screw Ends
from ¼ in. to 3 in. sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

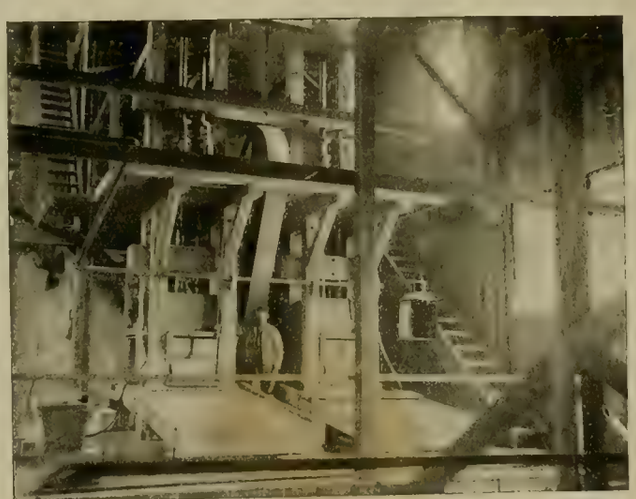
No. 1978.—VOLUME LXXVI. Number 23. SAN FRANCISCO, SATURDAY, JUNE 4, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Some Shasta Co., Cal , Mines.



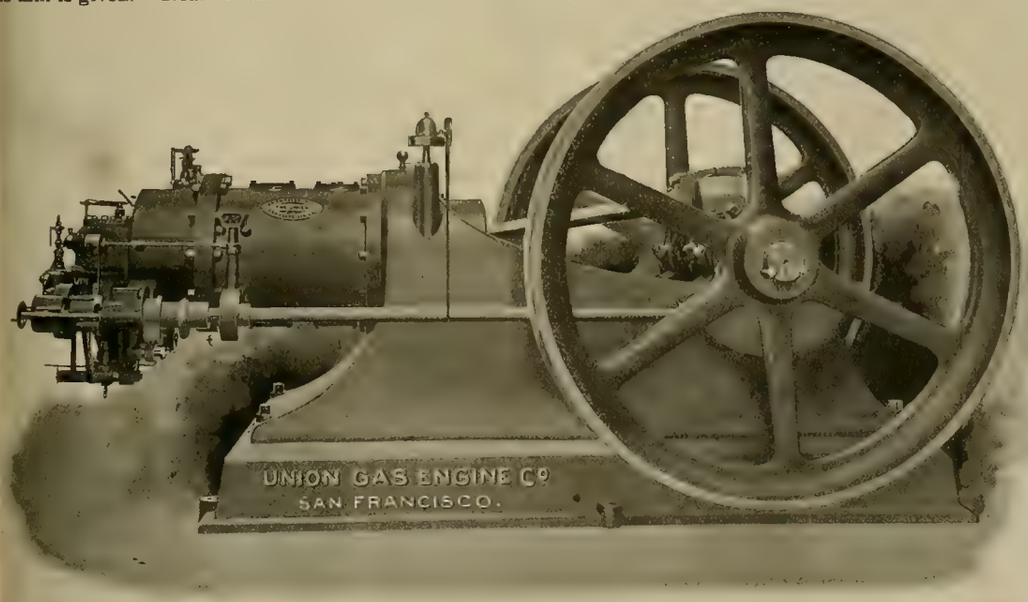
The early days of placer mining in Shasta Co. are giving way to quartz mining. The statistics published in last week's issue showed Shasta Co. to be first in the list of California mineral producing counties in aggregate value of production. As in other sections of the State, energetic work has shown that the surface yield of the old mining era was but an indication of the hidden values beneath.

Illustrative of this may be instanced the "Old Diggings" district, where the Texas Consolidated Mining Co. pioneered quartz mining in a section which, as its name implied, was old placer ground. A 20-stamp mill—the Hart—was built and supplied with ore from the adjoining properties of the company. At "Old Diggings" are also the extensive low-grade ores of the Mammoth, which has recently furnished 100,000 tons to the Mountain Copper Co., without much perceptible diminution of the quartz body in sight. At French Gulch the Gladstone mine, also illustrated herewith, now owned by the Euclid G. M. Co. of Cleveland, Ohio, has turned out about $500,000, twenty stamps crushing ore so "free milling" that concentrators are not used.

Near French Gulch is the Milkmaid mine, where a 10-foot wide vein of high-grade milling ore has warranted the erection of a stamp mill of ten 2-stamp batteries. An interior view of the arrangement of this mill is given. Near French Gulch is also the Niagara, a quartz mine that has produced over $2,000,000, and which gives promise of profitable yield at greater depth.

GLADSTONE MINE, FRENCH GULCH DISTRICT, SHASTA CO., CAL.

INTERIOR VIEW OF THE MILKMAID MILL, SHASTA CO., CAL.



THE HART MILL, OLD DIGGINGS DISTRICT, SHASTA CO, CAL.

Latest Type "Union" Gas Engine.

A recently designed "Union" gas engine, 60 H. P., is of interest, showing the progress made in the design and construction of these motors by the Union Gas Engine Co. of San Francisco. Its features are the same as in all the most recent "Union" engines. The liquid gasoline or benzine is piped to the inlet at the head of the engine. It is turned into gas only as wanted, and when drawn into the cylinder a large quantity of air is drawn in through the air valve, which valve is operated by a cam. The gas valve is normally closed and only opened when the engine requires a charge. This is controlled by the governor, which in turn can be set to run the engine slow or fast as desired, and being sensitive, the gas consumption is reduced to the minimum, only enough being admitted to the cylinder to keep the speed of the engine at the required point and always in proportion to the work performed.

Ignition is by electric spark, which can be adjusted so as to get the expansion on any part of the stroke desired, which is considered as great an advantage as a "cut-off" on a steam engine. No residue of burnt gases remains in the cylinder to mix with the new charge, all the burnt gas being expelled and its place taken by pure air, an economy, for there being nothing in the cylinder but combustible gas and air the maximum power can be obtained at small expense.

A 60 H. P. at H. Dutard's, near Campbells, Santa Clara Co., Cal., running a centrifugal pump against about 110 feet head, and indicating about 65 I. H. P., uses $4\frac{8}{10}$ gallons common stove gasoline per hour. Each engine over 20 H. P. is fitted with a self-starting device by which the engine can be started by opening a valve, the same as a steam engine. The weight of the engine shown in the cut is about 16,000 pounds.

SIXTY H. P. "UNION" GAS ENGINE.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 596. Starters for Gas Engines; Another New Process; Invention vs. War; Hubernite in Arizona; The Preparation of Chromium, 597.

ELSEWHERE appear some adverse comments on the manner of conducting the State Mining Bureau. The same matter was given editorial comment some months ago. It is to be regretted that so admirable and valuable an adjunct of the mining industry should have seemed fallen so far from its former high stand of efficiency, and, probably, the charity of silence is the most fitting comment. While, personally, the State Mineralogist is a worthy gentleman it is possible that he has failed to grasp the requirements of his present position, and that he is not acting in defiance but in ignorance of them.

THE usual marine disaster is reported befalling an unseaworthy vessel en route to Alaska gold fields. This time it is the schooner Jane Gray, which left Seattle, Wash., en route to Kotzebue sound, May 22, and three days afterward foundered at sea, with a loss of thirty-four lives. So much has been said about the folly of embarking on crazy old craft that it seems useless to more than casually refer to the recurrence of such dismal news. If men are determined to try for fortune in that far-off region they should at least take ordinary precaution for safety. So far there have been a hundred times as many Americans lost in the rush to the Klondike and northern Alaska as have been killed in the war with Spain.

WAR and its attendant excitement helps and hinders mining enterprises: helps in general by more active demand and hinders by individual distraction. Numerous projects involving the expenditure of considerable money have been sidetracked or diverted temporarily till comes the cooler atmosphere of peace. A case in point is sufficiently illustrative. Sixty days ago a mining superintendent said to the writer: "In about six weeks I will be through here, and shall put $12,000 in bond and development of a good Tuolumne Co. prospect." On Wednesday of this week he wrote: "Have just received a letter from the man who stood ready to put up the necessary money. He's been appointed Brigadier General by the President and says 'must wait till war is over.'" From present indications the Spanish matter will be speedily settled and then it is believed there will be even more activity than before in mining development.

Digest of Decisions.

In response to widely scattered and numerous inquiries it is deemed worth publishing a digest of the most recent decisions regarding mineral lands and mineral claims, made by the Secretary of the Interior and the General Land Office:

The existence of a mineral location raises the presumption that the location has been made in conformity with law, and that the land covered thereby is mineral in character.

Where mineral is found, and it appears that a person of ordinary prudence would be justified in further expenditure with a reasonable prospect of success in developing a mine, the land may be properly regarded as mineral in character.

A hearing will not be ordered on an allegation that a tract of land, embraced with a certified list of State selections, was not, on account of its prior known mineral character, intended to be granted to the State, except upon a strong prima facie showing in support of such allegation.

The burden of proof is properly upon one alleging the mineral character of a tract that has, prior thereto, been adjudged agricultural.

If the burden of proof as to the character of land s improperly placed, and accepted as placed without objection, the party so relieved from said burden is not in a position to complain of such action on appeal, in the absence of an attempt in the appellate tribunal to shift the burden, and apply the changed standard to the record made on the hearing in the local office.

In case of an attack on a mineral location of land that has once been adjudged mineral in character, the abandonment or forfeiture of the claim must be shown by clear and unmistakable evidence.

The non-mineral character of a tract of land having been determined as the result of a hearing held on that issue, the Department is not justified in ordering another hearing on the same issue, in the absence of a clear showing of development made since the prior hearing, such as, if supported by the evidence at the hearing applied for, would clearly demonstrate that since such prior hearing mineral has been discovered in such quantities, and by such thorough work on the premises, as to overcome the effect of the previous judgment as to the character of the land.

In a hearing ordered to determine the alleged known mineral character of land embraced in an agricultural entry, made at the conclusion of a prior contest involving the character of the land, the evidence must be confined to discoveries after the date of the first hearing, and prior to the allowance of the entry.

The notice of an application for a mineral patent should, in stating the names of adjacent claims, include unsurveyed as well as surveyed claims.

Failure to include in the posted and published notice of a mineral application the names of the nearest or adjacent claims, in strict accordance with paragraph 29 of mining regulations, will not render new notice necessary, where the notice as given is substantially in conformity with the practice heretofore observed under said paragraph.

Judicial proceedings are not effective as against an application for mineral patent if not based upon an adverse claim as provided by statute.

The failure of a claimant under a mineral location to make objection to the allowance of an agricultural entry of the land is conclusive as to the right of such claimant to be heard.

On appeal from the refusal of the local office to entertain a protest against a mineral application, the appellant is not required to serve the applicant with notice thereof.

Continuous possession of a mineral claim, with due compliance of law, for a period equal to the time prescribed by the statute of limitations for mining claims, in the State wherein such claim is situated, entitles the claimant, under the provisions of section 2332 R. S., to a patent in the absence of any adverse claim.

Prior to the approval of a railroad indemnity selection, the land included therein, if mineral in character, is open to exploration and purchase under the mining laws of the United States.

A surveyor-general who orders and approves the survey of a mineral claim is disqualified as applicant therefor under the provisions of section 452 R. S., and the department regulations thereunder, while holding such office.

A discovery of mineral on each twenty acres of a placer location serves to except the whole location from school indemnity selection.

Prior to the passage of the Act of August 4, 1892, there was no authority to locate and purchase lands chiefly valuable for building stone under the placer mining laws.

The Land Department has no jurisdiction to correct an alleged erroneous survey of a patented placer claim, while the patent is outstanding, so as to include land not applied for or surveyed.

Each of the above paragraphs is the summing up of a decision or ruling made in the particular case discussed.

Mining on Spanish Grants.

Among the subjects that will come before the Mining Congress at Salt Lake in July is the Ferguson bill, concerning the regulation of mining on Spanish grants. The first section of the bill reads: "That hereafter all mines or deposits of gold, silver, tin, antimony, zinc, bismuth and other valuable mineral deposits, situated within the boundaries of any land the title to which is derived from the government of Spain or Mexico, by grant thereof made prior to the conclusion of the treaties between the United States and the Republic of Mexico, on February 2, 1848, and December 30, 1853, respectively, and now embraced within the territories of New Mexico and Arizona, or within the States of Utah, Nevada, Colorado or Wyoming, are hereby declared to be free and open to exploration and purchase, and the lands on which they are found to occupation and purchase by citizens of the United States and those who have declared their intention to become such under the mining laws and the provisions of this Act." The passage of this bill, says the Denver *Mining Record*, would work no hardship to grant owners and would be a great stimulus in the development of a large amount of valuable mineral territory in the States named. The old system of Spanish grants was iniquitous and characteristic of the tyranny of that yellow nation. Undeveloped mineral is worth nothing to anybody, and when large areas containing such wealth are held arbitrarily without development the miner should be allowed to go in and prospect and purchase whatever territory he may find desirable for development. The original theory of the grants was that the lands were non-mineral, and had the United States Government regarded them otherwise proper precautions would have been taken to protect the miner in his mineral rights. Though a little late, there is yet time to do something in this direction.

THAT in the same river channels smaller pieces of water-worn gold are purer than the larger ones, and that the exterior layer of the water-worn nuggets is finer than the interior, is probably easiest explained by the fact that native gold always contains silver, and, on the average, about one-tenth of a nugget is silver. This is much more easily corroded than the gold, and is attacked, for example, by sulphureted hydrogen, and by common salt, both ordinary ingredients of surface waters. Such substances act upon the silver close to the surface of a nugget and dissolve it away, or convert it into brittle compounds which wear away as the nugget is rolled forward beneath the heavy stones at the bottom of a stream.

MINERS in the State of Washington have petitioned Congress to suspend the requirement of $100 worth of work or improvements on unpatented mining claims in that State for one year. It is not likely Congress will accede to the request. Such action would be of no benefit to any one. The laws are liberal, and in general any one who cannot or will not meet its requirements should let go. It is injurious to the mining industry and inimical to the prosperity of any locality to permit the continuous holding of unpatented mining claims without doing anything to justify such retention.

NEGOTIATIONS for the English purchase of the Redington, Cal., quicksilver mine, which have been in progress for some time, have not yet been closed. A. McMillan of Oakland, Cal., is the owner. The price of the property is $150,000.

California Mineral Land.

The mineral land bill of which so much was once expected has apparently been side-tracked in Congress by war matters. Apart from Federal legislation regarding railroad grants it is evident that the absorption of the mineral area in other ways needs attention. On this subject a recent writer says:

It is too bad that so much of the mineral land of this State has been permitted to fall into the hands of those for whom it never was intended. Aside from the wholesale absorption in appropriation by railroad companies of very large tracts, isolated sections all over the State, even in the center of the well-known mineral belt, have been taken up by people who do not intend to use the land for mining purposes. Small ranches or farms, orchards, pastures, etc., occupy the space in the mountains and foothills where mining plants should be found. All this is largely due to our poor system of determining and defining mineral lands by which it is not difficult to acquire them under false pretenses. Unless some one is sufficiently interested in a tract to enter a protest and maintain a contest before the land office the land even if notoriously mineral passes to the agricultural claimant or the owner of lieu land, school or other scrip. In some parts of the State, notably along the mother lode region, large tracts of exceedingly valuable mineral land are held under agricultural title acquired years ago when no one entered a contest against the applicant. Now, the prospectors are not permitted by the owners to go on to this land and prospect, and the domain of the prospector is thus narrowed and restricted right in the midst of the generally recognized and well-known mineral belt.

The *Mountain Echo*, in speaking of this gross injustice, says it has been carried on extensively in the southern part of Calaveras as well as in portions of Tuolumne county:

The Government is not aware of it, and the ordinary mortal in search of mining prospects, ignorant as how to proceed against the "grabbers," stands idly by, willing, but unconscious as how to act, in order to restore these valuble mineral lands to the public domain for the benefit of the prospector. The Government in disposing of the lands was defeated in receiving the established price of the lands, because of misrepresentation by unscrupulous sharks, and no contest being made, the purchases were made and the transfers confirmed. This vile work has been going on for some time, but an investigation will shortly be demanded, and men of character will give testimony in behalf of the Government as against the land grabbers, and results not now dreamed of by the general public will be brought about, and somebody and somebody's agents are going to suffer the penalty of the law.

Upon this subject A. H. Ricketts, of San Francisco, supplies the following, which, so far as known, is the first authoritative digest of law and fact published thereon:

All patents issued by the Government of the United States to pre-emption or homestead or townsite applicants are incontestible under the Act of Congress of March 3d, '91, unless suit was brought by the United States to vacate and annul the patent within five years from the passage of that Act if the patent was issued within five years before the passage of that Act. Under the provisions of that Act such suit must be brought within six years after the date of the issuance of the patent on all patents issued after the date of that Act.

This Act does not apply to Railroad and Wagonroad patents, which are subject to the provisions of the Act of March, 2d, '96, which extended the time within which such suits may be brought to six years after that date.

In commenting upon the Act of '91, the United States Supreme Court says: "Under the benign influence of this statute it would matter not what the mistake or error of the Land Department was, the patent would become conclusive as a transfer of the title, providing only that the land was public land of the United States and open to sale and conveyance through the Land Department. The purpose of Congress was to uphold titles arising under certificates or patent by providing that after a certain time, the Government, the grantor therein, should not be heard to question them."

Under the Act referred to the United States is barred from attacking the validity of patents issued for hundreds of thousands of acres of land in this State as non-mineral land, which area is, perforce, constantly increasing, and which in fact should be the lawful heritage of the miner and the prospector.

Of course, this bar applies equally to persons who might have been entitled to avail themselves of rights existing in the Government.

Railroad and Wagonroad patents are still subject to attack irrespective of the date of any of the patents as the statute of limitations has not yet run in their favor.

In the case of lands lying within the 16th and 36th sections, commonly called school lands, an action may be commenced at any time by persons who may hold mining claims therein although patent has issued therefor from the State. This, upon the theory that the mineral lands were excluded from the grant to the State and the attempt by it to grant the same is void. The question, therefore, to be determined in an action of this character is whether the land was known to be valuable for minerals at the time of the grant (March 3d, '53); if it was, the title still remained in the United States, and the State could take other lands in lieu thereof.

The important difference existing between patents issued by the United States to non-mineral applicants and the grant to the State is, that in the latter case the Land Department is not called upon to determine the character of the land, and the conclusive presumption that the land is of a certain character is not indulged in in school land cases. But where lands are selected by the State as in lieu of other lands the approval of the selection by the Land Department and the listing by it to the State, is equivalent to a patent. In that case it would seem that the Act of '91 would apply.

A Great Industry.

In last week's issue was published statistics in detail of the mineral yield of California and Colorado for the calendar year 1897, showing an aggregate mineral yield for that year of $25,142,441 for the former and $35,964,033 for the latter State. Other American commonwealths exceed even these figures. The national aggregate exemplifies the great extent and importance of the mining industry and justifies the effort to have proper national recognition by the creation of a Secretary of Mines and Mining, to have a place in the President's Cabinet.

Under date of May 25 are received advance sheets of Volume VI of the Mineral Industry, which makes a good presentation of the year's work, and which is approximately correct, and furnishes further argument for the fostering of so great a factor in the nation's wealth. In these is found a mass of carefully prepared figures and explanatory comment thereon, some of which is quoted as illustrative of the greatness of the mining industry of the United States.

The total value of the mineral production of the United States in 1897 was $746,230,982 as against $737,958,761 in 1896. The total value of the output in the last mentioned year exceeded that of the mineral and metal production of all Continental Europe, and nearly doubled that of the United Kingdom, the value of whose mineral output that year was approximately $340,000,000, that of Germany, $300,000,000, of France about $110,000,000, and of Belgium, $100,000,000.

The figures given for '97 in connection with the United States are limited entirely to ores and other substances mined in the United States and to metals reduced from those ores. In addition, there was also a large quantity of metals reduced or refined in this country from imported ores or base bullion. These are chiefly sent here for treatment from Canada and Mexico. The total production of this class reported was 584,983 ounces gold; 40,218,776 ounces silver; 26,938,254 pounds copper; 4,099,390 pounds nickel; 92,117 short tons lead; the total value of these metals being $47,127,174. This output of U. S. metallurgical works is altogether additional to that recorded in the table.

These metals were obtained chiefly from ore, bullion, furnace products and silver-lead imported from Mexico, Newfoundland and Canada. A comparatively small amount of gold and silver ore and bullion comes from Central and South America. There is also received a large amount of pyrites from Spain and Portugal, all of which contains a little copper. From British Columbia and Mexico come chiefly lead-bearing ore and silver-lead, from which a large part of the lead supply is obtained. The nickel is all from ores or matte produced by the mines at Sudbury, Ont. In the above quantities is not included the iron smelted from foreign ores, which is small in actual amount and insignificant in comparison with the total output; nor the manganese in foreign ores which enters into the composition of the spiegeleisen and ferro-manganese that is made here. The lead industry is the one most affected by the foreign material that is imported, the quantity of copper being comparatively small.

Aluminum.—The production in 1897 was 4,000,000 pounds ($1,400,000), as against 1,300,000 ($520,000) in '96.

Antimony.—The output increased from 1,226,000 pounds ($84,717) to 1,500,000 ($107,250). This was produced chiefly from imported ores; the production of domestic ores increased from 150 tons to 500 tons.

Copper.—The increase in production from 479,806,183 pounds in 1896 to 510,190,719 pounds in 1897 came chiefly from the mines of Arizona, Montana and California.

Gold.—The production in the United States increased from 2,558,433 troy ounces ($52,886,209) in 1896 to 2,864,576 ($59,210,795) in 1897. American refiners turned out 584,983 troy ounces ($12,091,599) of fine gold from ores and bullion imported chiefly from Canada and Mexico, making a total addition of $71,302,394 to the domestic supply of gold during the year.

Iron.—The make of pig iron in the United States increased from 8,623,127 long tons ($91,577,610) in 1896 to 9,652,680 ($92,677,312) in 1897. The production of iron ore was 16,000,056 long tons ($31,200,889) in 1896 and 18,316,967 ($31,138,844) in 1897. Upward of 66 per cent of the production of iron ore was from the Lake Superior region. The production of pig iron in 1897 was the largest for any single year in the history of the United States.

Lead.—The production of lead from ores mined in the United States increased from 174,692 short tons ($10,411,643) to 197,718 ($11,784,093). Besides this, there was a large amount of lead ore and silver-lead imported from British Columbia and Mexico and smelted and refined in the United States, part of it being re-exported.

Platinum.—A small amount of platinum is obtained annually in California as a by-product in the refining of gold bullion, estimated at 200 troy ounces in 1897, the same amount as in the previous year. The Director of the Mint reports also the production of 20.25 troy ounces of iridium.

Quicksilver.—The output fell off from 29,863 flasks ($1,104,997) in 1896 to 26,079 ($991,002) in 1897. There have been no new discoveries of late years in the United States which have come to anything, and the entire production continues to be from California.

Silver.—The domestic production decreased from 58,488,810 troy ounces in 1896 to 56,457,292 troy ounces in 1897. This large decrease is attributable to the heavy decline in the value of silver, which compelled a good many mines (whose ores contained their chief value in silver) to close down, especially such mines as the Ontario and Daly of Park City, Utah. The falling off in production would have been much greater had it not been for the comparatively high prices for lead and copper which stimulated the production of those metals, and, consequently, the silver carried with them. There was, therefore, a large increase in silver production from Butte, Mont., and the Cœur d'Alene. Colorado and Utah showed a large falling off in production, while there was an increase from Montana and Idaho. Besides the silver produced from ores mined in the United States, American refiners turned out 40,318,776 troy ounces of silver derived from ores, bullion and silver-lead imported from Canada and Mexico. The average price of silver in New York was 59.79c per fine ounce in 1897, against 67.1c in 1896.

Zinc.—The production increased from 77,637 short tons ($6,117,796) in 1896 to 100,387 ($8,271,889). This huge increase, which took place especially in the western districts, was brought about by the high price established for the metal by a combination of part of the producers and the establishment of several new works, and enlargement of the capacity of others, outside the combination. The production in 1897, which was thus increased so heavily, far outstripped consumption, and as a result the combination was obliged to market a good deal of its spelter abroad at comparatively low prices. The exports for the year were larger than ever before in the history of the United States. The final outcome was the disruption of the combination.

THE latest mining scheme is that of a Los Angeles, Cal., concern, which announces its object to be "to make mining a safe and legitimate business," which is a laudable object. The plan, as outlined in the prospectus, is "to offer to the miner or speculator every opportunity of gain, and at the same time secure him against the possibility of loss," a pleasing but impracticable programme. The following excerpt will be read with amusement by mining men:

We desire to call your attention to a few mines that have come under our immediate observation. The Utica mine, in this State, was bought for less than $3000, and is paying from $300,000 to $500,000 per month. What a royal revenue for so small an investment! The borax mines near Daggett were bought for $2400, and have paid $50,000 per month for twelve years. So, you see, with a small sum invested with us, you may acquire a competency for life with no risk of your capital.

The Emery Wheel and Its Manufacture.

The two abrasives which give the emery wheel its grinding and polishing qualities are emery and corundum. These two substances are practically the same abrasive, for the part of the emery that does the work is corundum. Emery is a mixture of corundum and the so-called oxide of iron—Mother Nature being the mixer. According to Prof. Dana, corundum has very little iron, while emery will average 46 per cent of the oxide. Emery therefore has a very dark gray, almost black color, while corundum is very light gray, with bluish and ruby colored tints. In almost any fair sized sample of corundum stone there are distinct traces of sapphire and ruby. Emery is mined in Turkey in Asia, in the island of Naxos, and in Chester, Mass. The Chester emery has a larger percentage of corundum than the foreign emery.

Corundum is found in commercial quantities in North and South Carolina, Georgia, Alabama and Tennessee. Corundum being free from an excessive percentage of foreign matter, possesses greater polishing and grinding qualities than emery. In the arts and sciences corundum is rated next to the diamond in hardness, emery coming next to corundum. Both emery and corundum are prepared for use in about the same way. They are crushed down to different degrees of hardness, and after being cleaned are graded in different sizes, ranging from No. 6 to the finest flour. These sizes take their name from the number of meshes to the linear inch of the wire cloth through which they are graded. The coarser sizes are used mostly in making emery and corundum wheels. The principal reason why more emery than corundum is used is the difference in cost, the miners of emery ore in Turkey receiving but 6 or 7 cents a day, while the minimum wages paid to miners of corundum in this country is 70 cents a day.

Another reason for the greater cost of corundum is the fact that emery ore is brought to this country largely as a ballast, and the cost to land it is therefore about one-twentieth of the cost attached to transporting corundum from the mines to the same points in this country. This increased cost for the transportation of corundum is due largely to the fact that the mines are considerable distance from the lines of transportation, and even when delivered at the railroad the rail freight is more expensive than the ballast freight of sailing vessels.

The principal difference between emery and corundum wheels is that one is made of emery and the other of corundum, the bond, or cement, holding the grains together being practically the same in each. An emery wheel is made of such diameter and thickness as will best suit the work required of it. It is made of different degrees of hardness, some requiring a soft, some a medium and some a hard texture. It is also made of different sizes of emery, depending on whether or not the work is to be coarse or fine.

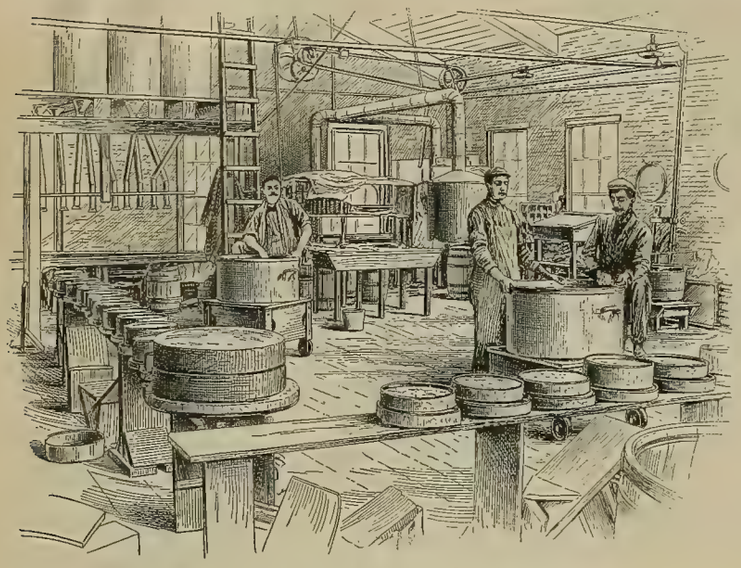

FIG. 1.—MIXING AND CASTING DEPARTMENT.

FIG. 2.—SHAVING DEPARTMENT.

FIG. 3.—KILN AND VITRIFYING DEPARTMENT.

FIG. 4.—TURNING AND TRUING ROOM.

The chief uses of emery and corundum wheels are to finish up and give a smooth surface to any iron, steel or metallic substance. Large quantities of them are used, as is well known, for gumming saws and grinding planer knives. In fact, they are sometimes called rotary files. One can readily understand that it would be practically impossible to name all the different purposes for which they are used. Their employment, however, can be summed up as follows: They are used for grinding, polishing, sharpening and shaping metal and wood substances. This does not cover all their uses, for wheels have been made for grinding feathers. They also do work similar to that required of the planer and lathe.

There are practically three classes of emery and corundum wheels—vitrified, silicate and chemical. Some users prefer one kind and some another. The vitrified wheel, of which there are the most in use, is burned in kilns, as shown in Fig. 3. The silicate comes next in quantity used. The difference between it and the vitrified consists principally in the difference in the bond used to hold the particles together, in that it is molded and tamped in molds, instead of being cast in just the sizes required, and then cooked or baked in ovens for a much shorter time and at not near as high a heat; also in that it can be made with or without a wire web. The Sterling Emery Wheel Manufacturing Company makes both the straight vitrified and silicate wheel, and also a semi-vitrified silicate wheel, which combines the best qualities of the other two. Referring to the illustrations of the principal departments of the plant of the Sterling Emery Wheel Manufacturing Company at Tiffin, O., Fig. 1 shows the mixing department, large tanks at the rear containing the different numbers of emery and corundum. A weighing appliance is underneath each, thus allowing the mixer to draw such sizes and quantity as are needed for the mixture. The wheels, after being mixed, are put in a dry room for one night. Fig. 2 shows the next process room, which is called the shaving department, where the vitrified wheels are shaved down to nearly the required size, leaving just enough allowance for contraction in burning. The wheels are then placed in a large dry room, where they remain until thoroughly dry before being placed in the kilns, one of which is shown in the next illustration. This engraving shows the kiln men placing the wheels in a kiln, where they are subjected to a heat of between 2500° and 8000° for about seventy-two hours, thus becoming thoroughly vitrified and one solid mass. The next process is shown in Fig. 4, where the wheels are turned up and trued to exact size, after which they are tested at a speed giving them a working strain of more than double that at which they should be run when in actual use. Besides this test, every wheel is tapped by an expert with a hammer the last thing before being packed for shipment, to make sure that no unsound wheel leaves the factory. Incidentally it should be mentioned that every emery wheel should always be tapped in this way just before it is placed on the machine for use, as it is not unusual that a wheel is so handled in transit that a latent crack is started and does not manifest itself until the wheel is in actual

use. John W. Bath, state inspector of workshops and factories in Ohio, states that, in his opinion, from investigations made by him, nine out of every ten emery wheels that burst are broken, or a crack started in them when the workman is putting the wheel on the arbor of the machine. This is the opinion of an unprejudiced party, and indicates that the user is at fault, and not the maker, for a very large majority of the broken wheels.

Fig. 5 shows the principal process in the manufacture of the Advance safety or silicate wheels made by the company. Here the men are at work tamping the mixture into molds. This, as will be readily understood, requires skill and experience on the part

FIG. 5.—MOLDING ROOM, OVENS IN THE REAR.

of the molder, as he must get the mixture in equally and in such a way that the wheel will be of the same hardness through and through, and hence run and cut uniformly. In the center of this wheel a wire web is put when so desired. After the wheel is molded to proper size, it is baked in the ovens shown at the rear of the cut. It is then taken to the turning department, Fig. 4, where it is trued up and tested by the same process as that of the vitrified wheel.

The wheels then pass to the shipping department. The works are so arranged that the raw materials come in at one end and proceed by regular stages to the other end, where the finished product is packed for shipment. A large stock of these wheels is kept by the San Francisco agents of the Sterling Emery Wheel Manufacturing Company, Parke & Lacy Co., 21 and 23 Fremont St., San Francisco.

Speed Government in Water-Power Plants.*

NUMBER IV.

MARK A. REPLOGLE.

Plate IV is intended to show the conditions of speed on a 2100-horse power plant when 1000-horse power of load is instantly added. The kinetic energy in the pipe at full load is 1000-horse power for one second. The power storage of the plant is 50,000-horse power for one second. Assuming that the speed of plant is at normal or zero line until it reaches vertical time line marked zero, where 1000-horse power of load is instantly thrown on. This being 2 per cent of the power storage, would cause a

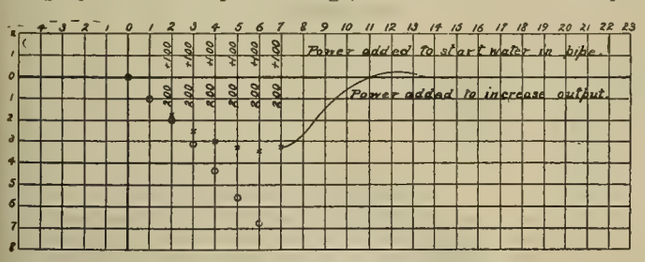

PLATE IV.

drop in speed of about 1 per cent during the first second after the change. If no power were added, the speed would drop a trifle more than 1 per cent during the second second, and continue to drop at an increasing ratio as the velocity of the revolving parts decreased. The curve indicated by the ciphers will show how the speed will drop during the following seconds if no new power were added to the wheel. Since it will require seven seconds to move the gates, the ratio of additional power supply will be 300-horse power per second, with a maximum action of the governor. Since the increase in load is 1000-horse power, and 500-horse power additional of kinetic energy must appear in the pipe, it will take the governor five seconds to add power enough to stop the speed dropping. Also, since the kinetic energy must be added to the flume in the same ratio that the new power is available, it is plain that only two-thirds of the 300-horse power added each second is available as additional power while the velocity of water in the pipe is being increased. Hence only 200-horse power is added as increased output for each of the following five seconds. This curve is indicated by the crosses at the ends of the several seconds. It can be readily understood that fully one second will elapse before any power supply can affect the speed of plant. It can also readily be seen that the power storage must carry the 1000-horse power new load for first second. While 200-horse power has been added during the second second, it has performed an average of 100-horse power work during this time. The power storage then has carried 900-horse power of the new load during the second second. Since the full 200-horse power is being added each second, the power storage is being gradually relieved of its drain and the speed stops dropping accordingly. A calculation at the end of each second shows exactly where the speed is at such time. Space will not admit the figures here, but the curve outlined by the crosses is approximately correct.

It is now evident that a formula can be deduced that can be relied upon in the government of water powers. It will be somewhat complex on account of the many factors that must necessarily enter into it. Many of these factors will necessarily be fixed by the conditions that attend the plant construction. The size of the power unit will always be decided upon first. Next will be the maximum change in load, with the greatest variation in speed permissible. The time of change in power supply is dependent upon the action of gravity and the safety of the plant. When the time required to supply power for the change of load has been learned, it is an easy matter to calculate the amount of stored energy or power storage that must exist in the plant in order to keep the variation of speed within the required limits. It will not be necessary to explain the fact that the speed will vary a fraction less in dropping off a load than it will in adding it.

In reducing the formula to its simplest form it will be necessary to combine or add together quantities that are of the same denominations, as follows: The time necessary to add power to overcome the increased friction in penstock, plus the time necessary to add power to overcome the inertia of the increased flow, plus the time necessary to add power for the new load, may be represented by T. The power necessary to equalize the increased friction, plus the power necessary to overcome the inertia in giving increased velocity to the supply, plus the power necessary to carry the increased load at speed, may be represented by L. The variation allowable in speed in terms that are a fractional part of normal speed may be represented by F, and the power storage may be represented by S. Since the power storage must carry the new load for one-half of T, and since the speed of plant varies in one-half of the ratio that the stored energy is given out or absorbed, it is evident that the formula must read:

$$\frac{T}{2}\,\frac{L}{F}=S$$

Further reduction makes it read

$$\frac{T}{4}\,\frac{L}{F}=S$$

The following example will make its use understood:

In the formula $\frac{T}{4}\,\frac{L}{F}=S$

Let $T = 4$ seconds.

$L = 1500$ H. P.

$F = 3$ per cent or $\frac{3}{100}$ variation in speed.

By substitution we have

$$4 \times 1500 = \frac{6000}{\frac{3}{100}} = \frac{12}{100}$$

$$= 50{,}000 \text{ H. P.} = \text{S.}$$

In the formula let T represent four seconds, L 1500-horse power, and F 3 per cent, or $\frac{3}{100}$ variation of speed allowable. In making substitution and reducing, the stored energy or power storage in the power unit must be 50,000-horse power. This is the amount necessary if 1500-horse power is to be added, and it requires four seconds to get the proper effect from the power supply, providing the variation in speed must not be over 3 per cent from normal.

(To be Continued.)

Gold Mines in Siberia.

BY RUSSELL L. DUNN.

All the exploited gold mines of Siberia are placer mines. There are no quartz mines, though the placer gold for the most part came from quartz lodes that can be profitably mined. Among the miners there is no knowledge of gold mining outside of the placers and the old Siberian methods of mining them. It is quite probable that in the course of the placer mining there have been numerous valuable quartz lodes uncovered, but the ignorance of the miners has operated to prevent them from realizing them as the source of the placer gold, and they have been covered up by tailings and passed by. I saw several strong quartz veins exposed by outcrop, but had no opportunity to examine as to probable gold value. Near Vladivostok, on a small island, I saw some small quartz stringers carrying gold. There was no continuous vein, the stringers seeming seggregations in some of the bedding planes of the country rock. Though values were high the quantity of minable rock was insignificant. Lower down the hillside and extending down to the seashore were placers evidently derived from the erosion of these stringers.

The exploited Siberian gold placers are shallow deposits made by the existing drainage system. They compare most closely with the Klondike placers and with the gulch and ravine placers of California and Oregon. In the basin of the Lena river and in much of the Nertschinsk district of the upper Amoor river basin the placers are perpetually frozen ground, only the surface thawing 2 or 3 feet in the short summer. In the maritime province known as South Usuria, the region adjacent to Vladivostok, the placers thaw out clear to the bedrock every spring and summer, in fact some of them never freeze to the bedrock at all. In the Lena and in the northern Amoor region referred to there is very little opportunity to use hydraulic methods of any kind, though it is possible to modify the Siberian method used and to cut its cost in two. There fire is used to thaw out the ground in sinking the prospecting pits in winter, but no attempt is made to mine out the ground by drifting, except the barren overburden capping the pay gravel should be very deep or where it is impossible to drain in summer. Exceptionally there are placers that are mined by drifting, using fire to thaw out the frozen ground first, but the method is not general. The customary way is to first thoroughly prospect the ground by shafts, next to mark out on the surface the limits of the projected working and to remove the 2 or 3 feet of surface after the first winter frosts.

At the same time drains are dug around the plot to keep surface water in summer out of the pit. When summer comes the heat of the sun thaws out the exposed surface of the pit to a depth of 2 or 3 feet. This is removed in carts and a fresh surface exposed to the sun heat to be in turn thawed. In successive benches the overburden is removed down to the pay gravel. This latter is then taken out in benches down to the bedrock as fast as it thaws. It is taken in carts to the Siberian gold washing machine and the gold recovered in sluices. The tailings, instead of washing away, are carted off to deposit points separate from the overburden. The method is needlessly costly, but its economical features will stand transplanting to Alaska, where the physical conditions are similar. A very considerable economy can be secured in operating the Klondike placers if the same method of winter prospecting be followed, marking out the ground to be worked in summer. The sun heat for thawing is far cheaper than wood. There is no occasion, however, to use horses and carts to move the softened ground. Water can be made to do this work.

In the South Usuria region the placers, which seem to average in richness with those farther north, are much easier to work. For at least six months of the year there is no frost in the ground. Water is plentiful, and by easily constructed ditches can be had under pressure. While the dump and

natural grade of the placers is generally insufficient for hydraulicking, combinations of direct hydraulicking and the hydraulic elevator are generally practicable. There are as well localities particularly adapted to dredger work. This section I consider, for gold mining, preferable to the interior. The climatic conditions are similar to those of Canada, the country is accessible and most of the ground is as yet untouched by miners. Very little of it is in the hands of expert miners; most of the placers are owned by farmers and prospectors, who have neither the capital or experience with which to exploit their discoveries. Labor is cheap and abundant and less conservative than in the interior. It will take more kindly to the superior picks, shovels and mining tools generally of foreigners than will the labor of the interior.

The Russian mining regulations are liberal and admit of the entry of foreign capital into the business. They have one defect, however, in that they are made with reference to the Siberian method in use now. They are not elastic enough to admit the operation of our hydraulic methods without modification. It would probably be safest for foreign capital proposing to operate gold mines in the Vladivostok region of Siberia to first get the authority to introduce new methods by application to St. Petersburg.

Three New Battleships.

The Navy Department calls upon shipbuilders to prepare to build the three battleships authorized by the present session of Congress, with a limit of cost, excluding armament and armor, of $3,000,000 each. Heretofore the limit of cost was larger, as it included armor, the navy always building its own guns. The board has decided that the three new ships shall be almost identical with the Illinois, the Wisconsin and the Alabama, now building at Newport News, San Francisco and Philadelphia, respectively, and in all probability the new vessels will be built at those places, at the Cramps, at the Union Iron Works and Newport News. The call provides for vessels of 11,500 tons displacement, with a coal capacity of 1200 tons on a mean draught of 25 feet, a length of 368 feet and 72 feet beam. The hull will be of steel, with double bottoms and close water-tight divisions, with ample freeboard and berthing accommodations on decks above water. There will be no sails, but two auxiliary masts with fighting tops. Two lifeboats will be carried so as to be rapidly lowered in all conditions of weather.

The side armor belt will be 7½ feet broad and 16½ inches thick through the engine and boiler space, tapering to a thickness of 4 inches at the bow and stern, and there will be transverse armor forward and aft, 15 inches thick. Barbettes for the 13-inch guns will be 15 inches thick except in the rear, where they will be 10 inches. The turret armor will be 14 inches throughout. The ships' sides above the armor belt as far as the main deck will be protected by 5½-inch armor, behind which coal is to be carried for further security.

The vessels will have a protective deck throughout the entire length, 2¾ inches thick where flat and 3 inches forward and 5 inches aft where it is inclined. A cellulose vat will be fitted along the sides of the whole length. The conning tower will be 10 inches thick and there will be additional armored splinter bulkheads between the guns, and the small guns will have shield protection and extra side plating.

The vessels will be driven by twin screws, with two vertical triple-expansion four-cylinder engines, one on each shaft and in separate water-tight compartments. There will be eight cylindrical single-end boilers with a working pressure of 210 pounds in four separate water-tight compartments. The weight of the machinery is limited to 1130 tons.

These ships are to be completed, under heavy penalty, within two and a half years. After they are delivered to the Government their guns and other equipment will be installed. Their main battery will be composed of four 13-inch guns in two barbette turrets, one forward and the other aft, and ten 6-inch rapid-fire guns in broadside on the main deck, and four similar weapons on the upper deck with the superstructure. Two submerged tubes will be provided with eight 17-foot torpedoes.

Accommodations must be arranged for a complement of 600 officers and men. The turrets and ammunition hoists are to be operated by electricity. A speed of sixteen knots is required, with heavy penalties for any deficiency, and if the vessel fails to make fifteen knots she may be rejected altogether.

THE process of extracting copper from pyrites, in use near Antwerp, is described in a paper by L. Breda of Ghent. The ore, containing 3 to 4 per cent of copper, is roasted, crushed and roasted with salt. The chlorinated ore in quantities of twenty-five tons is twice washed with some 660 gallons of water; then with the waste liquor from the precipitating tanks, then with dilute warm sulphuric acid, and finally with warm water. The washed ore at last contains only 0.2 per cent of copper. The liquor is run into tanks, and the copper is precipitated by scrap iron. The remarkable statement is made that by this means the amount of copper left in the waste liquor does not exceed 1.4 gram per gallon.

Successful Treatment of Tailings by the Direct-Filling Process.*

F. C. PENGILLY.

For several years past metallurgists have tried, but so far with indifferent success, the treatment of tailings by what is known as the direct-filling process. In this process the vat that is filled with tailings from the battery is treated directly by cyanide, instead of the contents being discharged into another vat for treatment. In other words, the usual "intermediate" or "settling" vats are dispensed with. There are two mines on the Witwatersand gold fields where the successful treatment of tailings by the direct-filling process is now being carried on. These are the Jumpers Gold Mining Company and the New Kleinfontein Company, Limited.

The following is devoted to a short description of the plant and the method of treatment adopted at the latter mine during the past six months, a method that has been worked with considerable success and given exceedingly good results. The plant consists of two slime separators, nineteen treatment vats, four extraction boxes and nine solution tanks. The slime separators are of the ordinary spitzkasten or pointed-box style, 6 feet square at the top and 6 feet deep. Of the nineteen treatment vats, thirteen are of 200 tons capacity and six of 130 tons capacity each. Around the top of each vat is a launder, which carries away the overflow into the slimes race. The nine solution tanks have a total capacity of 636 tons of solution, and each is connected with the three centrifugal pumps worked from a motor that pumps the weak, medium or strong solutions on to the treatment vats. The pulp, or tailings, after leaving the battery plates, is lifted by means of a tailings wheel into a launder, by which it is conveyed to the slime separators. The slimes from the first separator pass into the second, whereby a quantity of fine sand is saved that otherwise would flow away. About 15 per cent of slimes is eliminated in the separators, and the remaining pulp is run through launders into the treatment vats, which are previously filled with water. In the course of filling the vat another 10 per cent of slimes overflows into the slimes race, so that the resulting tailings to be treated in the vat contain but a small proportion of slimes. The vat is filled with tailings (sand) to within 1 foot of the top, when the stream is diverted into another vat.

Method of Treatment.—Each vat, after being drained of water, is treated with an alkaline solution to neutralize the free acid in the tailings formed by the decomposition of pyritic ores. As soon as the solution draining away is slightly alkaline, the treatment by cyanide solution is commenced. Various strengths of solution are pumped into the vats, each vat receiving during the course of treatment from 200 to 275 tons of cyanide solution. The length of treatment is six days, and the amount of cyanide used is 0.6 lb per ton of tailings. This table is a page from the logbook of the New Kleinfontein Company's cyanide works, which shows the exact method of procedure adopted in the works in the treatment of a vat of tailings:

VAT I., CHARGE I.—CAPACITY, 207 TONS.

Amount of KCy used, 5.9 lb. per ton.

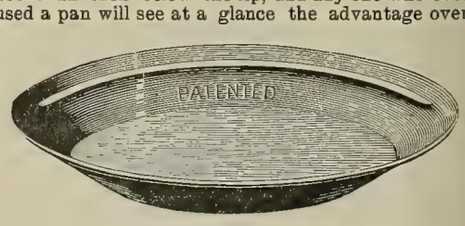
Precipitation of Gold in the Extractor Boxes.—The precipitation of gold from the solution coming from the treatment vats is effected by the means of zinc shavings. A certain portion of the ore coming from the mine is of a rebellious nature, containing sufficient foreign metals to retard, if not prevent, the precipitation of gold by zinc. To counteract the effects of these foreign metals, it has been proved efficient in practice on these fields to set up a lead couple, and at these works this is effected by dipping the zinc shavings in a weak solution of acetate of lead, preparatory to being placed in the extractor boxes. In all cases it is found that zinc containing from 1 to 2 per cent of lead gives the most satisfactory precipitation. By the use of acetate of lead a perfect precipitation is brought about, only traces of gold remaining in the solution after passing through the extractor boxes.

The zinc shavings are first placed in the weak solution box, and afterwards transferred to the medium, and thence to the strong. In the weak and medium solution precipitating boxes the gold becomes plated on the zinc, and less zinc is destroyed than in the strong. The solution from the extractor boxes containing only traces of gold is returned to the solution tanks, where, if found necessary, its strength is made up by the addition of cyanide.

Cleanup and Reduction of Zinc Gold Precipitates.—The zinc is taken from the boxes at the semi-monthly cleanup and washed by hand in an oblong wooden box. The washings are then placed on a screen of 700-mesh, when all that will not pass the screen is replaced in the extraction boxes, together with the washed zinc. The product that passes the screens, consisting of gold in the state of a black slime and fine particles of zinc, is placed in a vat containing a filter bottom, consisting of American duck placed over a wooden grating. The space between the filter bed is connected with a 2-inch Cameron pump, by means of which the excess of moisture in the slimes is drawn off through the filter bed, the solution thus drawn off being passed into one of the extraction boxes to prevent loss of very fine particles.

The slimes freed from excess of water are taken out and placed in another vat having a capacity of about five tons. A 10 per cent solution of sulphuric acid is gradually added, the whole mass being continuously agitated by means of a mechanical agitator. The acid dissolves the zinc, and when the solution is accomplished and no more action takes place, the vat is filled with water, the agitator being kept stirring all the time. When the vat is full of water the agitator is withdrawn and the slimes allowed to settle for an hour. The water is then decanted off, the slimes taken out, dried and roasted in a furnace, care being taken that the slimes are not disturbed during the roasting so as to cause any loss. The dried slimes before acid treatment contain 4 per cent of gold; after treatment this percentage is increased to 33 or 45 per cent. The average fineness of bullion recovered is 847 gold and 60 silver, the base metals being principally copper and lead.

Of the pulp leaving the mill, 73 per cent is recovered and treated in the cyanide works, and an actual extraction of 80 per cent of gold is recovered from this, or 60 per cent of the gold leaving the plates. The advantages gained by the use of the "direct-filling process" are numerous, chief of which is the smaller plant required. The cost of erecting eight settling vats of 450 tons capacity each, including foundations, trucks, filter-beds and piping, would be £6,000.



Interest on £6000, at 10 per cent	£ 600
Maintenance of settlers for twelve months, 10 per cent	600
Two extra shiftsmen in works, at £22 10 per month.	540
Discharging 192,000 tons of tailings, at 4d per ton...	3,200
Total.....	£4,940

This is equal to a profit of 6d per ton, or 2 per cent on the capital of the company, the actual working cost being 1s 11d per ton, including general charges and maintenance.

*New Zealand Mines Record.

New Improved Gold Pan.

Illustration is made of a new improved gold pan which is given considerable favorable mention by practical miners who have seen and used it. A flange or rim piece runs half way round the pan about an inch below the lip, and any one who ever used a pan will see at a glance the advantage over

NEW IMPROVED GOLD PAN.

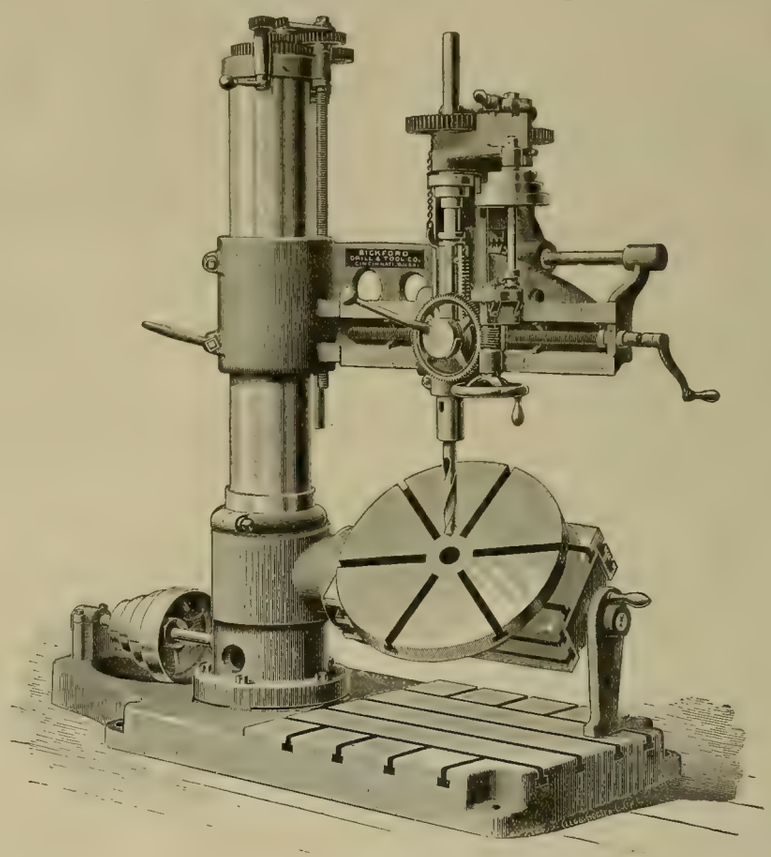
the old style. Practical miners who have used it say that for panning both fine and coarse gold, headings containing coarse particles of amalgam and quicksilver, it gives satisfactory results, and the work can be done in half the time required by the ordinary plan. It is claimed that in the use of this pan it is impossible to lose the gold, owing to the flange or protector being placed inside of it. The pan is to be manufactured and sold by the Joshua Hendy Machine Co., 42 Front street, San Francisco, where a sample may be seen.

Electrolytic Refining of Lead.*

S. C. COLES.

Lead, when recovered from its ores by smelting, is obtained as a crude metal, the so-called work lead, which has to go through a refining process in order to obtain soft or market lead. Work lead is obtained either by roasting reactions, by reduction, by roasting and reduction, or by the precipitation process. Refining is effected either by oxidation after fusion or by electrolysis. Lead is never obtained pure when smelted from the ore. It is almost always alloyed with all the other metals contained in the ore itself. Apart from the fact that the useful properties of the metal are affected by these other metals, it is, of course, advisable for economic reasons to recover the precious metals present, such as silver.

One of the first processes worked on a commercial scale for the electrolytic refining of lead by electrolysis was that of Keith. In this process the crude or work lead is melted at the lowest possible temperature in iron kettles from which it is tapped into moulds. The anodes thus produced are fastened to metal rods by suitable clamps, and enclosed in close-fitting bags of coarse muslin. The electrolyzing cells are made of wood or iron; the cathodes are thin metal plates attached to rods in a similar manner to the cathodes. The electrolyte is composed of lead sulphate dissolved in an aqueous solution of acetate of sodium; it is made by electrolyzing with lead anodes a mixture of 1½ lbs. of acetate of sodium, 2¾ ounces of sulphuric acid, and 1 gallon of water, and is heated to 28° C. The sulphuric acid attacks and the acetate dissolves the lead, zinc and iron of the anodes. The zinc and iron, being electro-positive to lead in the liquid, are less easily reduced to metal and accumulate in the solution, and when dissolved in considerable quantity are, to some extent, deposited as oxide on the cathode, the current density employed being about 1.86 amperes per square foot. The lead which is deposited on the cathode is crystalline in form and separates continually from the plates, a space being left in the cells for its accumulation. When the anodes have been dissolved, the bags suspended from their supporting rods are carried to a reservoir and the residual solid matter from the plates is washed and returned to the melting kettles. The slimes suspended from the wash water are allowed to settle, the water is drained off, and the residue filtered. The slimes usually contain antimony, arsenic, silver, copper, gold and iron. A process that has been recently tried on a commercial scale is that of Tommasi. In this case, the electrolyte is the double acetate of lead and potassium (or sodium), the anodes are crude argentiferous lead, and two of these are opposed to a copper or aluminum alloy cathode, which is in the form of a disk rotating at the rate of from one to two revolutions per minute.



These disks are about 10 feet in diameter and three-quarters of an inch thick, and are half immersed in the liquid. At the upper part are scrapers which serve to detach the small spongy crystals of lead which form during electrolysis. The crystals when removed fall into channels which convey them to a sieve of wire gauze where they are drained and washed, the wash water being concentrated by evaporation to 20 Baume (sp. gr. 1.256) and used again in the electrolyte. The lead is then compressed and mixed with 2 or 3 per cent of charcoal powder and fused. The silver, with most of the arsenic and antimony, is separated at the anode, and is collected in trays to be fused subsequently with sodium nitrate and a little borax, by which the silver is separated from the arsenic and antimony. The cost is estimated by the inventor at from 8 to 10 francs per ton of lead when steam power is used. When lead acetate is used as an electrolyte, the resistance is found to be lowered, which is probably due to the prevention of lead peroxide deposits upon the anodes, which must be at the expense of the organic substance itself, which becomes slowly and surely oxidized. The products of the oxidation of acetic acid are carbonic acid gas and water, which are of no intrinsic value. This being the case the acetic acid becomes an expensive electrolyte as it has to be constantly renewed. The lead peroxide formed at the anode is reduced by a portion of the organic acid to oxide, which then dissolves in the acid and becomes finally reduced to metallic lead at the cathode. The impurities present in the crude metal and the oxides on the face of the anodes are usually bad conductors of electricity, and, if they do not become detached from the anodes, they form an insulating coat over a large portion of the anode surface. The natural consequence of this is, that the current passes mainly through those parts of the plate that remain freely exposed, and so the current density becomes greatly increased at those portions, with the result that the anode is rapidly riddled with holes. The addition of acid carbonic acid when mixed gradually with sulphuric acid and digested for some time at a temperature of from 50 to 100° C. easily converts it into insol sulphuric acid, which is soluble in water, and is capable of forming soluble salts with lead. These salts have been successfully used for the deposition of lead.

Maxwell Lyte has suggested converting the lead into chloride and electrolyzing it in the molten condition. Crude lead is fused and oxidized by a blast of air in a converter, the oxide is then stirred with hydrochloric acid in earthenware vessels until it is converted into chloride. Any silver compound associated with the lead, salt or oxide treated, is chloridized and is extracted from the mass by the application of strong hydrochloric acid or brine.

Electrical Review, London.

Half Universal Radial Drill.

Herewith is illustrated the Half Universal Radial drill, manufactured by the Bickford Drill and Tool Co., Cincinnati, Ohio. This machine is made in two sizes, called styles "A" and "D." In both the base plate is heavy and deep, ribbed and braced on the under side so as to avoid all spring. The column, with large, round base, is bolted to the bottom plate, and over this column, with long bearing on top and bottom, is fitted the outside sleeve which carries the arm. The sleeve rests on the bottom, on a large flange, and is fitted with three clamping bolts. The rotating arm fitted over the sleeve is of box form, strongly braced, and raises and lowers by power. The flange of the sleeve is provided with roller bearings which allow the arm to swing with perfect freedom. The machine is driven by a cone pulley, shown on the back of the drill, and by miter gears through the inside of the column to the top. All sizes are fitted with back gearing. The spindles have automatic feed and are fitted with the Bickford patent quick return motion. The box table and the countershaft complete are furnished with each machine. The shafts, spindles, worm, worm rings and the main gearing are made of steel. All gearing is cut from the solid. The head of these machines may be swiveled at any angle upon the arm. The makers also manufacture full universal radial drills in which the head rotates and the arm revolves around its own axis, thereby making it possible to drill at any angle and in any direction within the range of the arm. The style "A" machine will drill to the center of a 10-foot circle and will receive 4 feet 10 inches over base. It weighs 6500 pounds. The style "D" machine will drill to the center of a 11-foot circle and will receive 6 feet 8 inches over base. It weighs 12,000 pounds. Full details in regard to these tools can be had from the Bickford local representatives—Messrs. Henshaw, Bulkley & Co., San Francisco.

HALF UNIVERSAL DRILL.

REGARDING the theory that gold nuggets are formed by the depositing of the gold around a nucleus from solution, A. Liversedge of New South Wales has made investigations which he thinks disprove it. By slicing the nugget and examining the cross sections obtained he found no traces of concentric coatings, but that the gold was always more or less crystallized, the crystals being in some cases very large and with well defined boundaries. Some of the nuggets also showed cavities and inclosures of quartz, although in many cases none were visible on the rolled surface of the nugget.

The State Mining Bureau.

TO THE EDITOR:—Is the State Mining Bureau dead or only sleeping? Very little is heard of what a short time since was the most practical and efficient of all the State Bureaus. The absolute reversal of the practice followed in the conduct of the Bureau under the predecessors of the present incumbent of the office of State Mineralogist has destroyed the efficiency of the Bureau. Aside from this, the change made by the present State Mineralogist is in direct contravention of the law under which the appropriation for the support of the Bureau was made by the Legislature. Under the law one-half of the appropriation must be expended in field work. As a matter of fact none of it is being so expended. The alleged mapping of the mines is not field work but office work. It is doubtfully Mining Bureau work, and certainly of no practical use whatever to a miner or to the advancement of the mining industry. So far is it from complying with the spirit of the law and the object of the Bureau organization that it is questionable whether the miners acting through some of their organizations should not enjoin the State Mineralogist from expending the appropriation for such purposes. The Bureau has been highly beneficial to the mining industry of this State and the world at large. So sought after have been the Reports that they command prices unheard of hitherto in the distribution of official reports generally.

Many of the papers prepared by specialists are in strong demand, though long out of print. Of some, second editions have been printed and distributed. All of this class of valuable work has been abandoned and worthless map compilation substituted for it. To what end these changes have been made is not apparent. The effect of them in creating a feeling that the Bureau, as at present managed, is useless, either dead or sleeping, is quite apparent.

MINER.

San Francisco, June 1st, '98.

IT has now been some time since anything new has been reported in the line of producing iron from beach sands. This week a Chicago inventor brings to notice a "metallic ore separator." The machine is of box form, has its front covered with brass plates, behind which are three electric magnets, one above the other and 22 inches apart, the end of the magnets coming in contact with the brass plates and magnetizing them at the point of contact. The sand falls in a stream in front of the brass plates and as it does so the particles of iron ore are drawn out, adhering to the plates, where they, too, are magnetized. The upper magnet catches the greater portion of the ore, the last particles remaining in the sand being caught by the lower magnet. A commutator breaks the current at intervals, thus demagnetizing the plates and allowing the accumulated ore to drop into hoppers, from which it is conveyed out of the separator.

Some Metallurgical Methods.*

NUMBER III.

The cost of smelting at Broken Hill, Australia, says Mr. Blakemore, varies from half year to half year, but on the whole has steadily decreased, until at present it costs about 25s a ton, including costs for superintendence, labor, repairs, water, fluxes, fuel, light, etc. In 1888 the cost of smelting amounted to 36s 6d per ton, with the pick of the ore to smelt. The costs given do not, of course, cover desilverization expenses, insurance, carriage on bullion, etc., but are simply the actual expenses incurred on a ton of ore in the blast furnace department from the time the ore is received from the mine until the bullion is made and put in the railway trucks ready to be despatched for further treatment. The lowest smelting cost per ton of ore was at the British furnaces on Proprietary ore from the 1st of June, 1894, to the 13th of September, 1894. The quantities of ore smelted were as follows: Carbonate lead ore, 4358 tons net; silicious iron and kaolin, 16,395 tons; manganic iron ore, 5279 tons; sulphide ore, 53 tons; total, 26,085 tons net. Coke used, 3801 tons, or 14.57 per cent on the ore; limestone used, 2452 tons; coal used, 59 tons; firewood equal to coal, 774 tons.

The total cost of everything, including rent of furnaces, water, coke, flux, coal, firewood, repairs, stores, light, salaries, assay expenses, and labor about the furnaces was £24,214 1s 11d, or 18s 6¾d a ton on the net ore. Manganic iron ore was good and plentiful, and therefore no ironstone had to be purchased, which, of course, materially helped towards the low cost of smelting.

Smelting Losses.—In the absence of any reliable method of sampling the ore the exact contents were never really known. "Grab samples" were the only means used to arrive at its value, taken from each mine truck as it reached the surface, and at the furnaces a man was kept on each shift to sample the ore as it was smelted. It was the crudest method of sampling possible, and naturally the results were just as crude and useless. Had accurate means of sampling obtained it would have been a great check on the furnaces, and given the general manager a lever—which he never possessed—on the whole metallurgical department. Certainly it would have saved many thousands of pounds yearly. Accurate assays were made out on the basis of the assays which were obtained from the samples, every little item being brought into account each week to the last fraction of a penny to get at the cost per ton of ore treated. These latter were correct enough, but the statement of the recovery of silver and lead was not worth the paper it was written on, inasmuch as the basis of the whole thing, the assay of ore, was the result of incorrect sampling. The samples were just as likely to show a greater value in the ore than it contained, or vice versa. Hence you would see that for one week the total extraction of lead was 70 per cent, silver 120 per cent. The next week the figures would show a recovery of lead 47 per cent, silver 65 per cent. These discrepancies can only be attributed to the incorrect method of sampling. Apparently more silver was recovered in the first instance than was in the ore, showing immediately the valuelessness of the whole return. A reliable statement of the extraction of silver and lead from Broken Hill furnaces generally is not to be obtained, but my opinion is that about 90 to 92 per cent of the silver and 65 to 70 per cent of the lead actually in the ore were recovered in marketable products. The loss in slag was great, because the proportion of slag made to ore smelted was from 1¼ to 1½ to 1, due to the silicious character of the ore. If the slags averaged 4 per cent of lead, which is within the mark, we get a loss on the ore; if it averages 15 per cent of lead in later days, of 5 to 6 units of the 15 in the ore, equal in the lowest slag output to exactly 25 per cent of the total lead put into the furnaces being lost. Other losses of lead take place in fumes and escaping flue dust, but are not so extensive as has been assumed. The flue dust recovered to from 0.80 per cent to 1½ per cent on the weight of ore charged into the furnace.

The following determinations give some idea of its principal constituents:

FLUE DUST.

Lead, per cent	25	37	23	30	30
Silver, oz.	20	24	30	21	21
Zinc, per cent	11	13	10.8	10.7	10

The usual method adopted with this material is to moisten it with water and return it to the furnace. Necessarily a great percentage of it rapidly dries and is carried out of the furnace by the strength of the blast back into the flues.

No particular effort has been made to make a better collection of the flue dust, the flues being designed simply to carry off the smoke and fumes, and accordingly the lighter particles of dust (and these are always rich in lead) are carried off by the force of the draught into the stack and fall outside on the surrounding land. Plenty of ore of good value has always enabled the company to pay good dividends, and the loss arising from escaping flue dust has not been felt.

The refinery is at Port Pirie, in South Australia, on the sea coast. The spot was chosen as being about the most convenient place having a water traffic for the largest ships, in the center of a good flux district, and with its sea advantages coal, coke and stores were landed at a price very considerably below the cost in Broken Hill. The last year or so the company have found it to their advantage to refine the whole of their output of lead, due to the extortionate charges and deductions made by English refiners. The plant is capable of handling some 800 tons of silver-lead bullion weekly, and is very complete in detail. It was designed by Mr. H. H. Schlapp.

The silver-lead bullion is first put into reverberatory furnaces, where it is melted down slowly, so that much of the impurities which it contains may be taken out at the commencement. This impurity or dross, as it is styled, consists almost entirely of an alloy of copper and lead with silver, one part of copper taking up sixteen or seventeen parts of lead. When the lead is all melted down the layer of dross skimmed off clean. The heat is then raised and by degress the small percentage of antimony, copper, iron, sulphur, etc., are skimmed off, leaving in the furnace a soft, easily marked lead and silver bullion. This operation takes some sixteen hours or more to finish. From the furnace it is tapped into cast steel or iron kettles of a capacity equal to that of the furnace. By the aid of a fire under the kettle the lead is made hot, and a small percentage of metallic zinc, from about ½ per cent by weight downwards, is added. This is well stirred in for some half hour or longer, and then the contents of the kettle are allowed to cool down considerably. As soon as the temperature falls below a certain point the zinc, which has alloyed with the bulk of the gold present, some silver and lead begin to separate out, exactly as cream rises on a dish of milk, and is skimmed off and kept for further treatment. The remaining lead and silver are then heated up to the melting point of zinc once more, and about 1½ per cent of zinc added. The cooling process is repeated, and the zinc-silver-lead crust once again skimmed off. This skimming or crust, known as the silver crust, in contra-distinction to the first one, called the gold crust, is kept apart from the latter. The zincing operation may have to be repeated once or twice before the lead is desilverized; usually half an ounce left is considered low enough. It is then syphoned off into a lower kettle by means of a Steitz siphon, made of ordinary 1½ or 2-inch black iron pipe. This lower kettle has a movable hood, and as soon as the temperature of the lead has been raised sufficiently dry steam is forced into the lead to oxidize the zinc which has remained in from the preceding operation of zincing, and also to remove the last traces of impurities. When the lead which contains the zinc is heated to redness it has the power of decomposing the steam, the zinc and some of the lead seizing on the oxygen of the steam to form oxides of their metals. These oxides gather on the surface of the lead and are skimmed off occasionally. Samples of the lead are taken from time to time, and the purity of the lead is judged from its color, and the ease with which it can be marked. Good soft lead is easily marked with the finger nail. As soon as it is decided that the lead is purified it is skimmed quite clean with wooden rakes, and then allowed to cool considerably, so that when it is cast into moulds it will set even and be of a silvery white color. Moulded at a greater temperature a bluish appearance is assumed by the lead, due probably to a film of oxide forming. When cool enough it is siphoned off into moulds, and then is ready for sale in the market as best refined lead. The Proprietary refined lead is remarkably good, and commands as good, if not a better, price than the English refined lead. This is due in a great degree to the small amount of impurity which the original bullion contained, and, secondly, to the care evidenced throughout the refining process.

We have now to deal with the dross, which was obtained at the commencement of the process. This is either sent direct to the blast furnaces to be smelted up with the charge, or else is put into the liquating or sweating furnaces, where it is heated gently to expel any metallic lead which has clung to the actual dross. This lead is run out of the furnace into an outside kettle, separately fired, to keep the lead obtained in a molten state; and when enough has gathered it is moulded into bars and returned with the next charge to the softening furnace. The dry liquated dross is then smelted in the blast furnaces with the ordinary ore charge. The zinc-silver-lead crusts obtained from the second zincing of the softened lead in the kettle are also liquated to free them from any lead which they may have gathered, and the lead liquated out is returned to the zincing kettle. The dry product left behind is put into graphite and clay retorts with a percentage of carbon, and highly heated. The zinc distills off, and some 50 or 60 per cent of it is recovered in metallic form in the retort condenser, the balance being recovered as an oxide known as "blue powder," some being lost in fume. As soon as the retorting operation is finished, which takes twelve to fifteen hours, the zinc condenser is removed, and the rich silver-lead bullion of some 5000 ounces to the ton is ladled out into moulds. The style of furnace is a modification of the Tatham retort furnace, and is not so handy as the Du Faur tilting retort furnace, which pours out the lead instead of having it ladled out. The retort is thoroughly cleaned, care being used because the heat has softened it considerably, and after cleaning some carbon in the form of charcoal is thrown in to keep the little lead left in the retort from forming litharge, which would rapidly destroy the retort. The latter is then ready for a fresh charge of the zinc-silver-lead crust. A retort lasts from twelve to thirty charges, and then is replaced by a new one. The rich lead bullion obtained from the retort is then taken to the refining or cupelling furnace. Here it is melted in a test or cupel (made of fireclay), cement and ground limestone being allowed four or five weeks to dry before being used, and as soon as the lead is hot enough an air-blast is turned on to the face of the bright red lead, and the operation of refining for silver commences. The action of the air is to oxidize the metallic lead into litharge, and this flows off in a stream more or less high with silver. As the level of the charge falls, fresh bullion is fed in through a small hole, but when the charge is almost pure silver, and the cupel quite full, this is stopped. At the finishing part of the cupellation the most beautiful irridescent colors traverse the face of the silver, due to the last traces of lead passing off. The temperature of the furnace has to be kept very high to keep the mass of silver molten. As the last signs of lead disappear the process is finished. The molten silver is then ladled into molds, and finally refined in large crucibles with nitrate of soda or potash, from whence it is poured into molds holding about 1000 ounces of fine silver each. The grade of the silver is about 996 fine; the remaining four parts usually consist of copper, with the very smallest trace of lead. The gold-silver-lead-zinc crust got in the first operation of zincing in the first kettle goes through exactly the same process as does the second crust just described. After it is made into bars it is, however, further treated for the separation of the gold and silver. The bars of this Dore silver, as it is called, are put into a cast-iron kettle, heated by a fire, filled with strong sulphuric acid, preferably of about 66 Baume. This is boiled until complete solution of the silver takes place, the gold being left as a dense black, finely divided powder at the bottom of the kettle. The solution containing the silver is either ladled or siphoned out of the dissolving kettle into a settling tank warmed by steam passing through a leaden coil. Here any fine particles of gold which may not have settled in the dissolving kettle are collected. The silver solution is diluted to about 24 Baume, and emptied into a precipitation vat, in which plates of copper are arranged. The reaction between the metallic copper and the silver sulphate solution causes the silver to precipitate and the copper to go into solution as a sulphate, so replacing the silver. The liquor left in the vat after the silver is all out is siphoned into vats, where the copper sulphate is crystallized out. The silver precipitated on the copper plates is then taken to a vat and well washed in hot water to free it from the last trace of sulphate of copper. It is then melted up and sold as fine silver and is about 997 fine.

The gold is sometimes pure enough to melt up into bars; but if not, it is boiled with fresh acid, then thoroughly washed, dried and melted. Since this method has been adopted, the Moebius electrolytic separation of gold and silver has come into prominence in America, and some writers claim for this process that the cost of separation does not exceed one-eighth of a halfpenny per ounce.

Chloridizing and Lixiviation.—The ore which is handled in these portions of the works is too low grade to pay the expense of blast furnace treatment, and it has to be mined to get at the other and richer ores; so there is a choice of two things, either use it for filling the stopes or treat it at a small profit. To get this small profit the chloridizing and lixiviation works have been erected. The first part of this plant consists of the necessity of crushing and power machinery for reducing the ore to the required state of fineness. Salt is added during the crushing operations from 4½ to 6½ per cent by weight. The mixture of crushed ore and salt is elevated into hoppers, from which the ore is automatically fed into a series of eight Howell revolving cylinder furnaces, which chloridize from thirty to forty tons of ore per furnace daily. All of the furnaces are not in constant work, some always being kept as stand-by furnaces, ready for use at any time.

The quantity of ore treated weekly averages from 1400 to 1500 tons, at a cost for all expenses, such as superintendence, coal, labor, salt, repairs, assay expenses, water, light, stores, etc., of 12s to 13s a ton on the gross ore crushed. The following analysis of the chloridized ore may be of interest:

	1.	2.
Silica	78.40%	78.00%
Pb Cl	3.76	5.37
Ag Cl	.042	.044
Na Cl	2.48	2.60
Fe_2O_3	8.62	9.00
Al_2O_3	0.14	0.15
MnO_3	5.07	2.55
ZnO	1.25	2.18
		Trace of antimony.

(*To be Continued.*)

Condensed.

Mining Summary.

CALIFORNIA.

Amador.

The shaft of the Amelia mine has reached a depth of 610 feet.——At the Central Eureka 135 feet was sunk in one month, at a cost of not less than $8.50 a foot.——At the Mason & Griesbach about 200 tons of good prospecting ore is on the dump and will be crushed at the Gracey mill.——At the Oneida drifting is in progress. Some good rock was found. A mill will be erected on this property this summer. ——The mill at the Red Hill mine closed after a run of about forty-eight hours. Circumstances were unfavorable for a continuation and the owner shut down. The mill passed, with the mine, into other hands June 1st.—— The owners of the Ironbound have bonded the old Soracco mine and are now running a crosscut about 400 feet in length, and will drain the shaft; prospects are favorable.——The Argonaut has a cash surplus of over $80,000 in bank, together with over $20,000 worth of rock on the dump and $10,000 worth of sulphurets on hand, making their surplus over $100,000. The mine started its mill only six months ago.——W. F. Detert, Supt. Zella mine, says that the Zella will probably discontinue present operations about July 1st next and begin sinking in the old shaft, which is to be sunk 200 feet deeper.——Whitehead & Bradshaw will soon commence hydraulicking on their claim.——Supt. Lyle closed the Fogus mine down last Friday and went to San Francisco.

The Amador *Republican* learns that work on the Alma mine will be commenced, after the annual meeting in July, under new management.——The South Eureka is now in the dividend-paying list. A larger mill is contemplated.——At the Wildman-Mahoney work on the new shaft is progressing, having reached a depth of 235 feet.—— Mrs. Hepburn is negotiating with Chicago parties for an early resumption of operations on the Bellwether mine.

Ledger: Gen. Mgr. J. E. Dye of the Jackson Exploration Co. started ten stamps of the 60-stamp mill this week.——W. Nevills Jr. states that he will soon reopen the Moore mine.——The contractors sinking the South Eureka shaft at Sutter Creek, 270 feet from the 1250-foot level, are completing their contract. The South Eureka is operating twenty light stamps. Besides the development work done, this company has accumulated some money, with which two dividends of $6000 each have been paid.

Butte.

The Butte Creek Gravel M. Co. near Adams continues hydraulicking under favorable circumstances.——The Denver mine is said to have struck an 8-foot ledge that is high grade and thirty men are employed. The tunnel is in about 1000 feet and the ledge has been tapped 400 feet below the surface. The 10-stamp mill is running regularly and the quartz is paying well. The company, H. H. Noble and J. Floyd, the former of San Francisco and the latter of Nevada City, intend putting up chlorination works during the present season. Extensive developments have been made on the ledge, so that it is known to be permanent.——The Bank of England Con. gold mine, comprising thirteen claims, is being developed under C. C. Antrim.——The Murray mine near Enterprise resumed work after a short shut down.

In the Gold Bank mine about 130 men are employed and everything is looking well. H. P. Stow, it is locally stated, contemplates putting in a large electric plant for the use of the mine and the people of Forbestown.

Calaveras.

Citizen: Gibson & Manley at West Point are running their 4-stamp mill night and day and are meeting with satisfactory results.—— P. C. Musgrave is doing good work at the Harrison mine; the 5-stamp mill is running night and day on good ore.——The Champion Co. is busy pumping out the old works.——The Keltz is taking out high-grade ore for shipment.—— Good ore is being extracted from the Machu mine, and the 10-stamp mill is running night and day. The ore is hauled two miles to mill. ——The Stella mine, on the South Fork, has suspended operations.——The Blizzard mine has been bonded to M. Armstrong of Los Angeles, who will develop it.——The Bear Mountain Co. is constructing an electric power plant on the Stanislaus river to transmit power to the mine and mill at Bear Mountain.

El Dorado.

Development work continues with success at the old Mt. Pleasant mine, near Grizzly Flat, which had been abandoned for several years.——At the Eagle mine the working force has been increased.——In the Crossman mine at Rescue the ledge, situated between quartz and slate, measures from 40 to 100 feet of mineralized quartz. The work on this mine is pushing ahead, and Supt. J. J. Crossman states that the company he represents will sink the shaft to a depth of 300 feet before erecting their quartz mill, although at present the quartz assays on an average $6 per ton, and if it will hold out to the level above mentioned the company will erect a 100-stamp mill without delay.——For the first time in the history of Kelsey three mills are in operation, the Gopher-Boulder, Big Sandy and the Sunrise.——At Grizzly Flat work continues in reopening the old Mt. Hope and Flagstaff mines.——It is said that the Hoskins property, comprising the Eagle and Grouse Gulch claims, on both of which considerable work has been done, have been bonded to a Scotch company, and that work is to be pushed.

Richardson & Koepfer, at Granite Hill, have taken out considerable ore, which they are hauling to a custom mill for a test crushing.

Inyo.

C. A. Weaver's mill at Ballarat is running night and day on ore from mines in the vicinity. Enough is stacked up at the mill from different mines to run a month.

The *Register* says that encouraging developments are made at the Molus mine, near Bishop, and the mill on that mine will shortly be in operation.——A mill is being erected on the Smith & Co. mine and will soon begin crushing.

Kern.

The *Rand* says that F. Fleming, while dry washing near Johannesburg, found a nugget that weighs $315.——The Butte mine employs fourteen men and is using five stamps continuously at the Red Dog mill.——The Sunrise and other low-grade ore mines at Johannesburg will ship ore to the Barstow mill.—— Work will not begin on the Alameda and Jolly Girls mines until October, when extensive development will be carried out.——The shaft on the Hector is nearing 200 feet.—— The 8-stamp mill at the Little Butte mine at Randsburg began operations. It is expected that $3 ore can be handled with profit.

Randsburg *Miner*: In the Butterfly mine at Rademacher at a depth of 40 feet a ledge has been opened 13 feet in width, carrying ore which will mill from $60 to $500 per ton.——H. Hirshfeld is developing several claims. T. A. Hall is Supt.——The Rademacher mine continues producing good ore.

Mono.

In the Standard Con. mine of Bodie for the week ending May 21st the regular prospecting work continued to be done on the 150, 200, 318, 470 and 582 levels in the New, Security, Moyle, Bullion, East, Station, Main, Standard, Black and Fortuna ledges. There is no change in the condition of the mine, which is looking well. The usual amount of fair to good ore was extracted during the week.

Standard mill statement: Ore crushed for the week, 291½ tons; average assay vanner tailings, $7.66; concentrates produced, 8¾ tons; assay value, $140.90; amalgam produced, 1427 troy ounces; value per ounce, $1.89. Tailings plant No. 1 worked 527½ tons tailings; No. 2 worked 355½ tons tailings.

Nevada.

(Special Correspondence).—The new shaft at the Homeward Bound mine of the Omaha Con. G. M. Co.'s property, near Grass Valley, has reached 1100 feet. The company has put in electric power at the new shaft to operate the pump and hoist. It will operate direct; there will be two motors, one on each side of the shaft, of 100 H. P. combined. At Nevada City the pipe line for the Champion mine has been completed, and the 40-stamp mill which was closed pending the construction of the pipe line, made necessary by the breaking of the dam at the reservoir, is again in operation. The temporary close of the company's larger mill explains the passing last month of the usual dividend. At North Columbia grading is in progress for the new mill of the St. Gothard Con. M. Co. It is said the new mill, to begin with, will have twenty stamps, which will be enlarged if results warrant. The ore body is large, but so far as developed is low grade. The electric power plant at the Brunswick, near Grass Valley, is completed and a test run proves satisfactory.

Nevada City, June 1st, '98.

The Red Dog mine at You Bet is making its last cleanup for the season. Lack of water compels the company to close work for the summer.——The Bellefountain at Nevada City is sinking from the 330 level.——The *Transcript* says that work on the new bedrock tunnel at the North Bloomfield mine is progressing. When the 800 feet of tunnel is completed the channel will be worked by the drifting process. Miners will then be put on as fast as room can be made for them, and it is expected that by next fall close to 150 men will be employed.

Transcript: The 40-stamp mill of the Empire mine of Grass Valley is being remodeled, and will be completed in six weeks; it will be one of the best arranged mills in the county. The concentrators are to be reset, and a drying room for the concentrates is being fitted up. Two dams have been built to impound the best of the tailings.

Placer.

The Gold Slide M. Co. began work on its property near Auburn. G. Huber is Supt.

Plumas.

F. Scott is taking out pay at his mine near Quincy.—— A number of men have begun mining on Chips creek.——The company working the Green Mountain mine under bond at Crescent Mills have surrendered the property to the owner.——The *Bulletin* says that a large channel of good gravel has been tapped in the Topaz-Centennial mine near Spanish Ranch.

Plumas *Independent*: A company is preparing to flume the Middle Fork of Feather river in the neighborhood of Bell's Bar. The location was flumed many years ago, though a comparatively small portion of it was worked, owing to the peculiar contour of the bedrock, which is as high at the lower end of the claim as it is at the upper end, dipping slightly as the work progressed, but sufficiently to prevent the proper drainage of the claim and thorough cleaning of the bedrock. The gold obtained for the season's work was sufficient to create a belief that a fortune awaited those who might be so skillful as to drain the ground. The present season is favorable to the work.——A bar farther down the river is being worked by men who are getting satisfactory returns for their labor.——At Rocky Bar fairly good pay has been struck.——At Rich Bar Wilson & Eaton are reported to have struck a good claim.——Minerva Bar will be opened up by eighteen men from San Francisco who are now on the ground. Residents of Nelson Point and Sawpit also are interested in the enterprise.——While it is not expected the output of gold from Plumas will equal that of last year, much of this year's gold crop will be gathered from placers where, but for the present low stage of water in our streams, it would have remained hidden forever.

Riverside.

In the Leon mine, near Perris, considerable development work has been done and there is a large ore dump that is said to mill from $8 to $12 per ton.

San Luis Obispo.

It is stated that by a process for burning and volatilizing the ore five men working quicksilver properties near Paso Robles are clearing $60 per day.

Shasta.

Near Stella there is considerable prospecting and mining going on, both in quartz and placer. The Desmond Bros. will erect a 5-stamp mill on their property. They have good ore and their claims are well opened.——The Manlove property has been worked since March by a crosscut tunnel, which is in 116 feet.——The copper deposits located by J. Davis have considerable development work done and a large body of ore has been exposed.——The Condon & Enos property, has a ledge from 4 to 5 feet in width that carries gold and is well opened.——McGinis & Co. will resume work in the near future.——Davis & Bishop are at work on a large sulphuret deposit carrying some free gold.

McLean & Co. have begun work on the Simonds property near Churntown, which had been abandoned several years. In a 50-foot drift they found a 6-foot ledge that yields good assay values.——W. Kemp is sinking three shafts on a copper property in Lewishon Camp.—— The National mine last week shipped 25,000 pounds of sulphurets.——M. Ware has six men at work near Keswick taking out ore, which he sells to the smelter.—— The 5-stamp mill on the Boyd mine, near Fort Dingee, is running on ore said to go at least $60 to the ton.

The output of the Mountain Copper mine has been increased to supply the smelting capacity. Power drills are being placed on the Hornet claim on the opposite side of the mountain from the present works, which has developed into a large body of ore. Two tunnels have been run 600 feet. The ore body has been crosscut, showing a width of 75 feet. ——The big smelters at Keswick are in full operation. Ground is being prepared, extending the roasting surface.——The new matte furnace has completed a successful run. This resmelting of the matte increases the percentage of value and reduces the freight charges to the refineries.

The pumping and hoisting plant at the Gladstone mine near French Gulch is almost ready. The machinery is operated by compressed air.

Sierra.

The Upper Dutch mine, near La Porte, got through with the season's work and, though the conditions for mining have been unfavorable this year, it is believed the company is satisfied with the cleanup.——The Claybank resumed operations in running the main tunnel ahead.——There are ten men employed at the Mountain mine at Sierra City, and in a short time, Supt. Pinney says, fifty more will be put on.

Siskiyou.

The Siskiyou mine near Fort Jones shipped over $4500. Piping will be suspended for the present and the mine put in shape for the next season's run.——L. A. McIntosh has purchased the interest of S. Clary in the California Queen mine, Cottonwood district. There is a 5-stamp mill on the property which will be increased to ten stamps. If the water becomes short, steam will supply power. A twenty-pound gold brick was brought in from this mill last week.——A land-dredging proposition is being contemplated by mining men on the Klamath river, near Oak Bar, on the Pine Grove placer mine, comprising eighty acres of gravel. The plan is to flood the land from the Klamath river, and work the gravel to bedrock with a dredger, an average distance of 14 feet. The gravel has been prospected and gold is distributed in paying quantities. The land is one and one-fourth miles in length.

The company represented by O. Howard, of San Francisco, who has made a deal for the old North Star quartz ledge on Humbug, has paid most of the purchase money with intention of working the ledge on an extensive scale.

The Greenhorn Blue Gravel Co. has struck a rich back channel, which is paying well, and there is also a good supply of bedrock water for the sluices.

Brown & Reeder, who were in Yreka a week ago with over $2100 from a week's run of their mill at Shasta river in Fool's Paradise district, have taken out $1800 more in a day and a half's run.——F. Lemay, on the old Hagedorn & Wademan ledge on Greenhorn, pounded out twenty-six ounces of gold and crushed five tons in which the gold realized $118. He is still taking out good quartz, with ledge varying from 16 to 18 inches.

Trinity.

Hutchins & Searles at Hay Fork are running a tunnel on the Goodenough mine.—— Johnson & Boswell at Hall City have run in a tunnel 250 feet.——Wilson & Brown have a good ledge of fair value.——D. T. Curtis of Oakland has bought a two-thirds interest in the Rattlesnake group of quartz mines near Weaverville. Men have been put to work on the property and it will be thoroughly developed. Mr. McLisle has charge of operations.——The Kindred & Burgess mine at Mad River has been reorganized under the name of Little Klondike. The dry season will give them a good opportunity to mine the low river bar that prospects encouragingly.

Tuolumne.

The shaft in the Rappahannock is over 1100 feet deep. The superintendent will sink to the 1100 before drifting or crosscutting for the lode.——In the Alameda Supt. MacDonald has resumed sinking below the 600-foot and will continue to the 1000-foot mark. Drifts north and south 50 feet each way have been opened showing a good ore body.——At the Monte Cristo the shaft has reached 100 feet. ——The Tarantula Co.'s shaft is 350 feet and good rock is found.——The Mascot tunnel at 235 feet has disclosed a 6-foot vein with a footwall, the value in free gold running from $5 to $6 per ton; sulphurets, $80. This company owns almost two claims. E. R. Ray is the superintendent.

The *Mother Lode* says that the mines at Quartz are doing well owing to the recent rains and snowfalls in the mountains.——The App mine is putting in electric power.

Democrat: In the Republican mine, near Jacksonville, it is said that a body of ore has been uncovered almost at the surface, of a good grade of ore. A 60 H. P. hoist, capable of sinking 1200 feet, is being built. Men are sinking a shaft; the vein shows from 7 to 22 feet wide. Water has been struck and, if necessary, pumping machinery will be put in. The quartz in the Republican resembles that in the Jumper. The mine is owned by U. S. Marshal Shine and associates.—— At the Longfellow mine the mill is kept steadily running, and clean-ups are said to be satisfactory.——The old Connard mine at Big Oak Flat, operated by the same company which controls the Sell, has its new shaft driven 60 feet.——Four miners have been put to sinking a shaft 100 feet deep on the Mazeppa. More men will be added and a double shift put on within a few days.——At the North Star & Black Warrior mine on Moccasin creek the tunnel reached the east vein. The quartz body has not been crosscut but the rock uncovered shows free gold, and there is reason for believing that a chute of high grade ore has been tapped.——At the Black Oak a new 250 H. P. steam plant is being put in. The two 10-inch plunger pumps have put in and the mine is in full operation.——Supt. Summers of the Sonora mine, formerly known as the Scanavino, has a force sinking the shaft, which has reached 100 feet. On the bottom the vein shows 16 inches of free-milling quartz. At 130 feet the first level will be established and the vein drifted both ways.

Yuba.

(Special Correspondence).—The Good Title M. Co. has resumed work, which was temporarily suspended pending adjustment of title to the property. The property is owned by Cincinnati people, who recently visited the mine, and concluded to continue sinking the shaft and making other developments.

Dobbins, May 30th, '98.

H. Vischer is making progress in his work for the Debris Commission in the South Yuba river near Smartsville. He has sunk fourteen shafts to bedrock and is now making a map of the work to be submitted to the commission.

The Marysville *Appeal* says of the Pennsylvania mine that the ledge is as large and as valuable as when the recent strike was made, and there remain years of operation ahead. The mine has not shut down, but will within a very short time, or as soon as certain pending arrangements are concluded, be working more men than ever. Extensive improvements are under way at the present time.

NEVADA.

The Magnolia mine at DeLamar shipped another carload of gold ore of the value of $225 per ton. This is the second lot shipped from the property the present year, and the property is now in condition to make regular shipments during the summer. The haul to the railroad is long and expensive and only the ores that afford a valuation of $200 or better to the ton are marketed. While this high-grade class is being made to provide for developments and a sinking fund with which to continue in the winter, the vein is being steadily prospected, and to handle the main body a mill will be put in next season. Mr. Eisenman is Gen. Mgr.

The Victor mine, near Lovelock, has been sampled by four different experts; for 150 feet of the ledge the returns show from 42 to 62.5 ounces in silver and $6 to $8 in gold to the ton. A shipment of nine tons to the Reno mills gave 111 ounces in silver and $6 in gold to the ton.

At Eureka, owing to smelter competition in the ore markets, who have not only made a heavy reduction in the working charges, but also raised the price they pay for lead perceptibly, the Eureka sampling works has discontinued work.

The Humboldt Sulphur Co. will begin shipping sulphur via Humboldt station so soon as the wagon roads are in condition for hauling. ——The Dexter mine at Tuscarora last week shipped gold bars amounting to $6500, and auro-cyanides to amount of $4000.——M. Sohr has bonded the sulphur mines near Battle Mountain and will shortly begin work on them.——T. J. Bell has bought the New Pass mines situated on the western line of Lander county.——The Sunset mine, near Gold Creek, embracing eleven claims and some placer ground has been bonded to Eastern people and a contract let for 500 feet of tunnel.

OREGON.

The mill on the Bellevue mine at Bellevue is handling twenty-five tons of ore per day and outputting concentrates that yield from $60 to $70 per ton. The capacity will be increased to forty tons a day. D. Keith of Park City, Utah, is the owner.——The Barron & Sheppard quartz mine, near Ashland, is having fifty tons of ore hauled to the Ashland mill.——The Ashland-Mattern mine is running a full force and keeps its 10-stamp mill busy.——A ledge of copper ore resembling that of Iron Mountain has been discovered near Ashland.——The placer ground of Phillips & Co. has averaved 20 cents a yard for their season's work.——The Nonpareil cinnabar mines in Douglas county have been bonded to A. B. Quinton of Topeka, Kansas. ——The Ashland *Journal* says that C. E. Pot-

ter struck a piece of placer ground near Oak Flat which pays at the rate of 50 cents a wheelbarrow load. Three days' work, after hauling the gravel 250 feet, yielded $27.50. ——Browning & Hannum, on the Greenback mine on Grave creek, brought to Ashland a lot of gold dust and nuggets which were melted up into two gold bricks, one weighing $2500 and the other $1500, the result of crushing sixteen and one-half tons by an arrastra.

The Ashland *Tidings* says that Jones & Co., who purchased the Mt. Reuben mine, have at a depth of 350 feet crosscut the ledge and have 14 feet of quartz assaying well.

WASHINGTON.

The Cleveland mine, near Springdale, is shipping two carloads of ore.

Pioneer: D. Snyder discovered a ledge near Republic that assays 600 ounces in silver and $50 in gold.——H. Lily is developing a property which at shallow depth assays $14.10 in gold.——At Meyers Creek the Wisconsin mine is producing $60 ore.——The Medalion mine has a 6-foot ledge of $36 ore.

BRITISH COLUMBIA.

The following are the principal stockholders in the Le Roi mine and the amount they will receive from its recent sale for $3,000,000, if the sale stands:

V. Peyton, Spokane	$432,000
D. N. Peyton, Spokane	420,000
W. D. Turner, Spokane	240,000
W. J. Harris, Spokane	234,000
W. M. Ridpath, Spokane	228,000
George Turner, Spokane	192,000
J. G. English, Danville, Ill	129,000
D. W. Henley, Spokane	120,000
J. M. Armstrong, Spokane	120,000
W. A. Peyton, Danville	98,000
Mrs. W. D. D. Turner	90,000
E. D. Sanders, Spokane	90,000
Frank Graves, Spokane	84,000
C. L. English, Danville	81,000
L. F. Williams, Spokane	78,000
H. M. Casey, Spokane	24,000
L. D. Gass, Danville	24,000
W. J. C. Wakefield, Spokane	18,000
R. B. Blake, Spokane	18,000
J. B. McLaren, Vancouver	18,000

The R. E. Lee group of five claims, in the Slocan, has been bonded by L. Alexander to an English company for $100,000. Work on an 800-foot crosscut tunnel has begun.——Work is being pushed on the O. K. and Lucky Boy properties in Boundary Creek. The ore now on the dump is said to assay from $80 to $100 in gold.

The Highland, near Rossland, has found a second vein 15 feet wide. The ore in the new ledge carries some copper.

UTAH.

(Special Correspondence).—In the Treasure Hill mine, near Silver City, the ores are mainly oxidized iron, carrying silver values principally, though there are some sulphides. It is being developed from a 350-foot vertical shaft, with levels every 100 feet. The main working level runs 700 feet on the vein. About twenty-five tons per day are being taken out and shipped to the smelter. A strong vein of water was struck on this property. F. B. Cook is Mgr. and S. J. Penberthy Supt.

The Homestake, in the same locality, is being developed and has a 500-foot shaft. The Martha Washington shaft is down 350 feet, with two levels. Present workings are in ore. Some of their shipments brought good returns in gold, silver and lead.

The South Swansea is shipping 300 tons per month from the workings in their 750-foot shaft.

The Grand Central, whose grounds extend from the Mammoth to the Centennial-Eureka, is becoming an excellent property. The ore body comprises an immense zone. The shaft is 700 feet deep and from this shaft drifts are run 500 feet to cut the ore body, where the ore is produced from drifts and stopes. The vein or ledge is opened at the 200, 400, 700-foot levels. Two air drills are operated. Shipments run from two to two and one-half cars per day. For the month of April forty-eight cars were shipped. The values run from $30 to $100 per ton. The work of opening the mine has been under the immediate direction of Pat Donnelly, the foreman.

The Bullion-Beck is shipping seventy-five tons per day of first grade ore. This goes direct to the smelter, the company's concentrating mill being closed down. This ore, which comes from the 1300-foot level, runs about sixty-five ounces silver, 15 per cent lead and $1 per ton gold. On a different ore chute, in the south part of the mine, at 950 feet depth, the ore is running 10 per cent copper, thirty-five to forty ounces silver and $6 per ton gold. In general, a lean streak was encountered at 900 feet, but on going deeper the present stronger values were found. In this mine a large amount of ore is blocked out. About 120 men are employed under the superintendency of J. A. Kirby.

The Centennial-Eureka reports more satisfactory values from the 900 to 1100-foot workings, in the form of copper of higher grade. This is the new feature in later workings of this mine. The copper ore runs from 15 to 19 per cent. The property is not shipping heavily at present.

Tintic district freight rates average about $2.50 per ton on ore shipped. Smelter rates are governed by contract, according to the grade of the ore and as to lead values. It is estimated that the district ships about 9000 tons per month. The Taylor & Brunton Ore Sampling Co. report that for the first four months of 1898 they have handled 13,000 tons in excess of the quantity they handled within the corresponding period of 1897.

Eureka, Utah, May 17th, '98. WASCOTT.

(Special Correspondence). — When the decision was made by the Highland Boy management to build their present amalgamation and cyanide mill, their underground workings were in the main confined to an extensive ledge of oxydized ore, with values largely gold. Subsequent and deeper workings have taken them through the oxydized ores into a still more extensive zone of copper sulphides, which require the work of a smelter. A walk through the various tunnels of the mine shows that there remains an abundance of milling ore in the oxydized belt, but the company claims there is no economy in milling it, when the ores of the entire proposition can be smelted with a better result. A decision has, therefore, been reached to build a smelter down in the valley, and build a railroad from the smelter to the mine. It is announced that the mill will be closed down very soon. The mine is developed extensively from three tunnels. No. 4 cuts through the oxydized ledge into the sulphides and is 1300 feet long. No. 5 is 1200 feet long, all in sulphide ore; No. 6 is in 700 feet in the sulphide ore.

The Old Jordan and Galena are about completing a cyanide plant to run in connection with their concentration mill. There are crushing, rolling and drying machines and nine leaching tanks, having a capacity of 100 tons per day.

The Fortune mine in Pine Gulch is opened by several tunnels. The main tunnel runs in on the vein a distance of 1500 feet; a second, above the main, goes in 600 feet on the vein, and a third 350 feet. The ores in the upper tunnel are carbonate of lead and silver; galena and copper in the lower; and sulphide of copper, carrying gold and silver, in the main tunnel. Some shipments have been made from the lower tunnel. A mill will be erected here.

Geo. L. and Fred H. Bemis of Bingham; John L. Weber and John J. Kearns of Park City, and D. N. Swan of Salt Lake City, are completing a concentrating mill at Bingham. It will be known as the Dewey Consolidated.

Bingham, Utah, May 20, '98. WASCOTT.

From a fourteen-day run the Mercur mine yielded $23,100. The mill crushes 150 tons of ore per day. The company contemplates building an auxiliary plant.——The Montreal mine near Milford, recently purchased by the Glasgow & Western Expl. Co., has begun work.——Developments on the Cuba, near Bingham, have resulted in finding ore running high in copper and carrying some gold. ——In the property of the International M. Co. at West Tintic good milling ore has been found 250 feet from the surface; the vein is 15 feet.——The finding of an 8-inch vein of good ore is reported in the Sunday claim.——W. Green, working the Buckeye mine under lease, reports the discovery of a 2-foot vein of good ore on the 270-foot level, and shipments will commence shortly.——The Tintic *Miner* reports a shipment of eighty-one cars of ore, fourteen cars of concentrates, and twenty-five bars of bullion.——The Ajax shaft is 572 feet deep, 20 feet having been sunk during the week.——The Mammoth made a shipment of crude ore.——J. W. Judd disposed of a small interest in the Napoleon claim near Mammoth for $1100.

F. M. Bishop of Salt Lake City is said to have found a sulphur deposit near Sunnyside that is 50 feet in width, can be traced 500 feet and in places stands 20 feet out of the ground. ——At the Mammoth mill sixty stamps, the full number of the mill, are dropping regularly and a total of 200 tons of ore being worked daily. The new East Tintic railway is hauling down the hill the greatest tonnage in its history, being an average of about 300 tons daily. Last Saturday the road made its star record of 443 tons.——In the Dalton and Lark, which has been submerged for many months, the water is reduced to the 800 level, and by June 1st all the drifts will be accessible and under full operation. Mgr. Schenck expects to begin the extraction and marketing of ores fifteen days later, and will then push the drift leading to the big lead bodies in Dump ground. From the silver zone assays made just before the pulling of the pumps show from 20 to 250 ounces per ton.—— The Martha Washington made another shipment of ore. Although the pay streak at the property at this time is such as to restrict it to periodical shipments, the grade of ore is high and nothing containing less than 100 ounces in silver is permitted to go into the lot. Associated with this is $4 in gold.—— The Horn Silver shipped seven cars of concentrates, while the Niagara sent in eight cars of crude ore running in silver and lead from Bingham.——The Hercules, near Stockton, made a strike by which it is believed the largest body of ore found in that locality has been uncovered. The strike was made on the 200-foot level and has been crosscut 20 feet, without reaching the limit. The values are about 50 per cent lead, 30 ounces silver and $7 gold.——The Hercules is producing a good grade of lead and silver ore.

On the Golden Dream mine at Monticello a large quantity of ore ranging from $30 up, in free gold, has been piled on the dump during the last month.

A. P. Adams of Albany, N. Y., and Engineer E. H. Ryan are on the San Juan river, near Monticello, preparing to run a tunnel through one of the goose necks, of which there are many on that river. The tunnel will be about 4000 feet long, and will drain four and one-half miles of the river bed, along which four and one-half miles A. L. Raplee, with hand rockers and a water wheel, has for three years made a comfortable living. The new company, the San Juan River Placer M. & P. Co., proposes to work this stretch of placer ground on a larger scale and will put in machinery this summer to run air drills and push the work. This section of the river has bars which yield from 3 to 50 cents per yard in scale gold.——The Hickory and Montreal mines, near Milford, have resumed ore shipments. The product is copper, gold and silver.

The Mercur *Mercury* says the Mono tunnel has reached a distance of over 2000 feet. The character of the ground in the tunnel is changing, and it is expected that a strike will be made in a short time.——At the Glencoe the tunnel has reached 600 feet, from which point crosscutting has begun.

At Fish Springs a strike of high grade silver and lead ore has been made in the Last Chance No. 1 by Thomas & Evans, who are working the mine on a ninety-day lease. The shaft is down 45 feet and the ore body covers the entire bottom.——Brown & Higgs, who are working the Last Chance No. 2 in the same locality, are taking out sufficient good ore to pay expenses.

Hawkins & Co. have a showing of copper ore near Frisco that indicates the proving of a new mine. An open cut has been made for about 30 feet in length by 6 feet in width in ore almost the entire dimensions. Forty sacks of the ore will run 30 or 35 per cent copper and $5 gold to the ton, and the second-class dump is said to average 8 per cent copper, $2 gold and five ounces silver. The property is known as the General Solomon mine.

Tribune: The ore and bullion market settlements for last week amounted to $287,776. The figure is the largest attained by any corresponding period the present year, and now that the roads between the mines and railways are drying up, sampling men and ore buyers are relying on a steady increase.

Tribune: The Daisy mill at West Dip will be ready for operation July 1st. The plant will have a daily tankage capacity of 300 tons. Mgr. Mayne is pushing work underground. As did others, Mr. Mayne demonstrated in an experimental plant that the ores of the Daisy could be successfully cyanided, and as the work of construction goes on, experiments by which to determine the smallest amount of cyanogen necessary to get out the gold are kept up. In this he has made valuable discoveries. —— Capt. DeLamar's representatives have bonded several properties at Bingham and are making experiments on the ores. The results will be submitted to Capt. DeLamar upon his arrival in July.——The station for the pumping plant in the property of the West Mountain Placer Co. at Bingham is completed. Within a few weeks the raising of water in the shaft will be commenced. The station has been made at a depth of 150 feet from the surface and will be occupied by a Corliss engine of 120 H. P, together with a Cornish pump capable of 1500 gallons per minute.

IDAHO.

(Special Correspondence). — The Twin Springs Placer Co. have developed and practically completed a hydraulic mining enterprise on the Boise river, forty miles northeast of Boise. The project was started two years ago and the work has been done under the management of J. R. Anderson, with J. O. Bouse as engineer. Twenty-eight miles of wagon road, a sawmill and eight miles of flume have been built. The flume is 6 feet 2 inches wide in the clear, carrying 5 feet depth of water and having a grade of 10 feet 8 inches to the mile. The flume line includes two rock tunnels, 668 and 185 feet long, respectively, which are side-lined and full size of the flume. The line crosses the Boise river through an inverted siphon, which is of 4-foot pipe, works under 370 feet head of water and is supported by a bridge of 140-foot span, 85 feet above the water. The lower section is made of ¾-inch steel, double riveted. It has four expansion joints. The siphon, which will be completed in June, will furnish new scientific data. It is claimed to be the largest of the kind in the world, both as to diameter and degree of pressure. The flume carries 10,000 inches of water. There are fourteen giants working at different points under an average of 320 feet pressure. The company own thirty-two miles of the channel and contiguous grounds along the Boise river.

Boise, Idaho, May 26th, '98.

(Special Correspondence). — The most important development in the Hailey district is on what is known as the gold belt, twelve to fourteen miles west of the town of Hailey. More properly it may be called the iron and copper sulphide belt, carrying gold values, to distinguish it from the argentiferous-galena belt, nearer town, where the old workings are. This gold belt, according to local authority, can be traced fifty miles to the westward. Sufficient work has been done to warrant much confidence in the future of that belt; and Hailey, in the picturesque Wood River valley, is already feeling that her mining energies may be partially turned from the silver properties of the old region to the development of the gold belt with far-reaching results in her favor.

The best development in this belt is found in the Tip-Top mine, in charge of Capt. J. M. Lusk and belonging to J. Q. Packard of Salt Lake City. This property is developed by about 2300 feet of levels and crosscuts and an incline shaft 325 feet deep. One level goes in 600 feet on the vein, from which various side workings occur; another level 100 feet below the first follows the vein 750 feet, and connects with No. 1 through a winze; a third level still below the first two, has been driven 100 feet on the vein. The ore chute is between 300 and 400 feet in length. The vein runs from 5 to 15 feet in thickness, and dips at an angle of 45 to 60 degrees. The ore is an iron and copper sulphide, the main values being in gold. To the depth of 450 feet they are partially oxydized and it is believed from 40 to 50 per cent of the gold therein may be saved by amalgamation. The gangue rock is a quartz and porphyry-granite. The superintendent asserts that the building of a mill is contemplated, but that to avoid any mistake as to the kind, the most thorough tests are first being made. This property is well equipped with buildings and facilities for development.

The Golden Star, a mile or two from the Tip-Top, is simply undergoing development, but in the course of this work its ores will be milled, the management having leased Camas No. 2 mill which is equipped for amalgamation and concentration. It is expected this mill will start up about June 1st. The mine shaft is down to a depth of 240 feet and sinking continues. Levels are being run at 100 and 200-foot points from the shaft. The shaft, slightly inclined, goes down under the footwall of the vein. The ores encountered are similar to those of the Tip-Top. This property belongs to Chicago and St. Louis parties who have ample capital. J. Ainsworth is superintendent.

The Burning Moscow, in the vicinity, is being developed by Doniphan Bros. On this property a ledge 12 to 15 feet wide has been tapped by a crosscut tunnel 400 feet long. This is in the midst of a lava formation and the vein is somewhat broken.

The Idaho Recovery Co., of which Messrs. Wiswall & Frank, of Denver, are managers, are operating a cyanide plant on the tailings from two different mill sites. The work of the season has just been inaugurated by Mr. Frank, and some twenty or more solution tanks are being used. This plant is situated at Doniphan, in the gold belt.

Nearer Hailey are the Crœsus and Hope, neither one operating to any great extent at present, which carry good gold values in iron and copper pyrites. The Crœsus has a 10-stamp mill. It is believed that both of these will soon be started up.

The Jay Gould, at Bullion, in the silver-lead belt, is working with a good force of men and is shipping regularly.

The silver-lead belt extends from Bellevue to the Sawtooth range, about seventy-five miles, and is from eight to ten miles wide, with varying values.

The shipments of ore from Hailey to the smelters amount to about 200 tons per month. The sulphide ores go to Salt Lake City and the galena ores to Colorado smelters.

Hailey, Idaho, May 28th, '98.

Rand & Burd have sold three claims to an English company. The price is locally reported to be $250,000. The property is 46 miles from Boise, the nearest railroad point. One of the claims is developed to a depth of 622 feet. The new owners have put ten men to work.——Wells Bros. have made a quartz discovery near Payette. The ledge is 3½ feet wide and the ore will mill about $40 a ton. They have two claims.——In the Tip Top mine near Hailey an ore body has been found from 3 to 38 feet wide and 300 feet long at a depth of 200 feet. The 300 level is also being opened.

The Basic M'g Co. is engaged in building a dredge at Placerville. The boat is 100 feet long and 40 feet wide. It will draw 3½ feet of water. The hull is 7 feet deep. The plan of working by dredges of this character is to dam the stream, making a pond in which the dredge is floated. The water for sluicing is pumped from the pond. The dredge will be operated by electric power. The electricity will be generated by water power. Fourteen miles of ditch have been constructed. Of this three and one-half miles is of flume 4 feet on the bottom and 3 feet high, having a capacity of 1000 miners' inches. The fall will be 350 feet and the power afforded will amount, at the minimum, to 500 H. P. The line over which this power will be conveyed to the dredge will be between ten and fourteen miles in length. The company owns twenty-four miles of creek bottom.——The New York mine, near Idaho City, has been sold to a British Columbia company, represented by Irving of Vancouver. The consideration has not been made public. A first payment has been made and the new owners have put men to work. This is a gold property, considerably developed, and shows large bodies of ore of fair grade.

Prospectors have recently staked out a large amount of placer ground on the bar between Boulder and Gold creeks, near Coolin. It is claimed by the parties who did the work that they are employed by a company of Spokane and Eastern capitalists. It is said that the company will put in a large hydraulic plant. They will take the water from Boulder creek, where a good head can be obtained high above the bars.

Two sets of Cornish rolls have been put in the DeLamar mill at DeLamar, and the ore will go into the leaching tanks crushed to more uniform size than formerly. The mill, at greatly reduced expense, is handling more ore and giving better results than the old process. More men are being put in the mines.—— The Johnny Sheals mining property, near Mountain Home, was sold to Denver people. It is the intention of the company to expend $100,000 in development work, beginning this fall. A mill run of forty-one tons averaged from $60 to $65 a ton.

At Silver City the tunnel on the Mammoth has reached 250 feet in a hard formation.—— At the Cumberland mine the mill is running steadily and bullion shipments have begun. The lessees, Sonneman & Branscombe, have expended $25,000 on the property since last September in development.

The Salt Lake *Herald* says that the McNutt placers on Moose creek, near Leesburg, have been sold to a Chicago company for $150,000 cash. The same company is operating two electric dredges at Bannack, and it is the intention to use two similar dredge boats on the McNutt placers, which are to be extensively worked this summer.

Statesman: The New York mine in the Basin has been sold to British Columbia mining men. The purchase was made by Dr. Irving of Vancouver. He has made the first payment and work has been started. The property is near Idaho City.——The cyanide plant recently installed on the Golden King mine at Dixie is reported an entire success. The ore being milled runs $10 a ton in gold and some silver. The extraction is close to 90 per cent. The plant is handling twenty-five tons a day crushed dry through a 20-mesh screen. Two hundred tons were worked as a test. Each lot was cleaned up separately and the results determined. It was found it required one and a half pounds of cyanide per ton to extract the precious metal and about a pound of zinc for purposes of precipitation. The tanks used hold twenty-five tons each. It requires seventy-two hours for the leaching process to be completed. The cost of cyanide laid down is 35 cents a pound, making the cost per ton of ore for the chemical 52½ cents. The zinc shavings cost 6 cents a pound. Mr. Brant thinks the amount of zinc required after the

plant shall have got into good running order will not be more than half a pound per ton of ore.——C. P. Richardson, near Newsome, has a 30-foot bank of gravel on the Moose Creek placers which prospects well, with 5 feet of pay on top of the bedrock.——Gavin & Co. have bonded the Buckeye quartz claim in Dixie district and begun development work on the claim.——Pennman and Yetter's property, near Elk City, is showing a body of ore 4 feet in width of good values.

MONTANA.

The Elgin mine at Rochester is operated under lease by a Butte company. An ore body running from $20 to $30 has been opened, the daily product being about ten tons.——The Buffalo mine has 4000 tons of ore on the dump.——The season promises to be a very active one in placer. Alder Gulch will give employment this year to at least 100 men.——Work on the big dredging plant of the Conroy Placer M. Co. has begun. M. Delaney of New York will have charge of the construction. The plant is designed to handle 1000 cubic yards of gravel daily.——The German Bar Placer Co.'s plant is in operation.

The South Bend M. & M Co., South Bend, Ind., capitalists, has secured 160 acres of placer ground near Libby. A force has been put to work sinking shafts to bedrock in various places, and several thousand dollars will be expended in prospecting. So far the returns have been satisfactory, and there is little doubt that the company finds itself justified in putting on expensive machinery. The ground covered by the claims also contains numerous old channels. One feature of the company, never tried in Libby, is saving the black sand which forms the residue in the pan. Repeated tests of the sand show that it carries a value in gold, with no trace of any base. It is also rich in iron, which gives it specific gravity, and renders it valuable to the smelters as a flux. Enough of this black sand to make a smelting test will be shipped, and, if the result is satisfactory, concentrating tables will be put in. The plan of the company is to put in a dredge. R. L. Nicar is Gen. Mgr.

The *Miner* says that at the Alice mine and mill twenty men were let out during last week and twenty stamp heads stopped in the mill. This leaves a total of forty heads now at work. The suspension is owing to a temporary shortage of ore, and in all probability the men will be reinstated shortly. There are about 100 men working on leases in the Alice and the Magna Charta.——The Butte & Boston at the East Gray Rock has begun sinking from the 1400-foot. The water is very fast in this mine, and, although a large pump constructed from an air compressor is in use, great difficulty is experienced in handling it.——At the Hope mine, at Basin, the shaft has been sunk to the 400 level, and by June 15th is expected to be down to the 500. Before then a new hoist will be put in, as the present plant is not strong enough. It is said that the Basin Gold & Copper M. Co., which now owns the property, has spent about $32,000 for machinery, labor and supplies since beginning work in January.——It is stated that the reorganized Golden Sceptre Co. at Quigley will soon be in operation. J. R. McDonald has succeeded in reorganizing the company on a solid basis and has made arrangements to have the plant, on which $650,000 has been spent already, completed in a very short time. The tramway from the mill to the mine will soon be in operation. The ore is low grade gold, running about $4 to the ton; but with the mill and tramway completed, it is said it can be treated for about $1 a ton. The machinery for the mill, including an electric plant, is all on the ground and will soon be in place under the general management of J. R. McDonald.——It is reported in Butte that the Con. Granite Mountain Bimetallic Co. will soon resume work on their silver properties near Phillipsburg.

Helena *Independent*: F. Longmaid has been sampling a placer mine near Beartown and has returned with a sack of gold. He secured an option on the property at $10,000 last fall. To thoroughly prospect the property he utilized the melting snows of the spring in washing the gravel through a steam washing plant. Two thousand yards were treated, and the result averaged 90 cents a yard. Mr. Longmaid estimates the cost of operating at 25 cents a yard, and figures the amount of undeveloped ground at 600,000 yards. It is intended that 500 yards a day shall be handled. A steam shovel and pumping plant will be used in the work.——J. Leahy will have charge of the dredging plant initiated near Montana City by A. MacDougall of Duluth. Work of this year will begin shortly. He is putting in an elevated dredge. The centrifugal pump operated last year was not a success, and the owners lost money on the season's run. With the new plant it is expected that a yard a minute will be handled with eight or ten men, and hopes of a profitable season are based upon the new method to be introduced.——The Great Falls *Tribune* says there is more activity in mining matters this spring in the various camps of the Little Belt mountains than has been apparent for several years. The purchasing of ores and leasing of mines by the United Smelting Co. at Great Falls has been a large factor in the mining industries of Barker and Neihart, which are now two of the busiest silver camps in the State. As regards other sections in the Belt range, prospecting and developing have been going on quietly for a year or two, with the result that this year, if cheap transportation can be secured, new producing mines will be in the field. In Yogo, Frazen & Co. have a 200-foot tunnel in on a large vein of sulphides and carbonates, bearing lead, silver and gold. Assays from ore on the dumps, of which there is considerable, give 40 ounces silver, 50 per cent lead and $3 gold.——It is stated that the Alabama Co. at Landusky contemplates erecting a cyanide mill to be put in operation on the Alabama mine. The company is the owner of seven mines in the Little Rockies, the Alabama being the only one developed. Twelve tons of its ore were hauled eighty miles overland and shipped to Aurora, Ill., and are said to have netted $5900.——The Judge mine at Castle has 700 tons ore ready for shipment.

The Dillon *Examiner* says that Jones & Austin of Chicago have bought a large property in Madison county, mines which have been worked for several years, principally for lead, but the ore contains gold and silver values which by a process of concentration Jones & Austin expect to make the leading factor in the productiveness of the property. Fully 20,000 tons of gold ore are in sight in the 900 feet of shafts and tunnels, besides 250 or 300 tons of lead ore, which runs 70 per cent pure. It is proposed to put in machinery this summer to work the gold ore, also a system of ditches and a water wheel for the development of the water power available.

SOUTH DAKOTA.

The tunnel in the Power mine at Two Bit has reached 200 feet. They have a ledge 3½ feet wide that assays $22.40 per ton.——The shaft in the Chicago & Two Bit Co. has reached 325 feet.——The shaft at the Great Northern has reached 185 feet, and traces of copper have been discovered.——The American Express property has discovered a new ore shoot. The ore shipments from this property last month were over 500 tons.

WYOMING.

Near Rawlins, Denver and Salt Lake capitalists have invested over $100,000 in placer properties which will be operated this summer.

MICHIGAN.

The Boston News Bureau is told that the No. 6 shaft of the Osceola mine is the best shaft and will probably be the most profitable shaft ever put down at Lake Superior. It will in time take the place of two or three other shafts and will take out more copper mineral the next ten years than any present shaft at Lake Superior unless the Whiting shaft of the Calumet & Hecla is made to do duty. When the levels in this shaft are opened up the output of the Osceola mine proper will be enlarged, while the output from the Tamarack Jr. of the Osceola and from the Kearsarge property with the new Iroquois shaft will be increased.

ONTARIO.

The Cameron Island mine, near Rat Portage, has delivered 100 tons of ore to the Kewatin mill for a test run.——At the Independence mine at Sturgeon Falls the 5-stamp mill is in operation. Some of the ore mills as high as $140 to the ton. Development work is being pushed.

COLORADO.

In the Victor mine, Cripple Creek, the main shaft is 680 feet deep and the last level runs 80 feet above that point, in good ore. The mine is outputting from 100 to 125 tons per day. The first grade is settled for on an average of $250 per ton, while the second grade is good for $80 to $100, while the third or mill ore averages close to $25 per ton. Mgr. N. H. Cone says there is hardly an end to the amount of low-grade ore in sight in all of the levels, while of the high-grade there is sufficient to meet the big payroll for a long time to come. This mine has paid dividends in the past five years close to $1,000,000. The ten or more ore teams loading at the mine are a thing of the past, as everything in the ore house now goes into the cars direct, and a big engine hauls it to market over the Florence & Cripple Creek road.——The output of the Legal Tender is approximately sixty-five tons per day, the smelting grade averaging from four to five ounces, while the mill dirt carries about one ounce per ton. The shaft is down 600 feet and within the last 10 feet passed through the vein that dipped into the shaft where the pay streak was found 4 feet wide. Sinking is to continue for 200 feet more before another level is started. Mgr. Cone says he is not crowding work, but slowly opening up a mine for the future. At present he is meeting the running expenses in addition to the usual dividend of $10,000 per month.

The Raven is outputting about enough ore to meet the payroll and the regular dividend of 1 cent per share. A great deal of development work is being done. A crosscut has been started from the tunnel to prospect a portion of the company's ground not yet entered by the tunnel. This crosscut will cut the Wide Awake at a depth of fully 800 feet.——Some very rich ore is being mined in the Elkton. Shipments have been made from it in the past that in carload lots went as high as $200 per ton.——Crosscutting for the vein from the bottom station of the Anchoria-Leland at 800 feet has commenced. The shaft has been run down until the capacity of the pumping plant was reached, and in a short time the vein will be opened at a depth reached by the Portland and the Independence. To more directly aid the work a diamond drill has been sent out from the shaft to locate the ore, and it is understood the test has been entirely satisfactory.——Saunders & Co. have resumed shipments from their lease of the Isabella Co. They are again in good ore at 270 feet and are shipping from fifteen to twenty tons daily.——The Meldrum tunnel at Ouray has closed down temporarily.——Cripple Creek mines are paying dividends at the rate of $2,000,000 per annum. Total dividends to date, $5,000,000; total output, about $38,000,000.—— A strike has been made in the Calumet mine, Ohio creek, Gunnison county. Eighteen inches of sulphide ore, that will assay two ounces gold, twelve silver and 80 per cent lead, is said to have been uncovered. There is also 2 feet of concentrating ore that will assay $20 in gold, silver and lead.——The Rebekah M. Co. at Gilpin, operating the Gettysburg, contemplate putting in hoisting machinery at the mine and erecting a 10-stamp mill, rapid drop, with the latest improved concentrators.

The Revenge mining property, near Eldora, is in paying ore. This claim is being worked under a bond and lease of $20,000. The three first shipments ran $54, $112 and $96 per ton, respectively. The tunnel is 210 feet on ore all the way. The vein is 6 feet wide, while the pay streak averages 1 foot of high-grade ore.——The Besse R claim on Spencer mountain shows a 3-foot vein of sulphide ore.——The Grover Cleveland and Summerset mines, on Spencer mountain, at the depth of 60 feet, shows a vein that runs $150 first grade and $50 second grade per ton.——At Victor steady shipments are made from the Mattoon lease on the Shertloff, the ore running from $25 for mill stuff to four ounces for first grade. Edwards & Wolfe, on the Star of Bethlehem, are continuing shipments from the 70-foot level, while pushing down the shaft.——A good strike has been made in the Penobscot claim, near Central City, the ore giving assay values of twelve ounces in gold per ton.——The production of the Carr mine on Bobtail hill for the past month was $2875, taken out with a small force. The production was five tons first-class smelting ore at $115, twenty tons second-class smelting ore at $85, eight cords mill ore, $600.——At the Next President mine, drifting in the 380-foot level, Supt. McLeod has been taking out some fair ore, the pay streak showing yellow copper and lead, though not in sufficient body as yet to make shipments.

At Cripple Creek the Gold Coin mine is outputting 130 tons per day.——Lessees on the Colorado Boss are getting ore from a shaft 75 feet deep. The rock is expected to ship at from $40 to $60 a ton.

In the Lost Lillie at Cripple Creek is a streak 4 inches wide which assays twenty ounces silver, $10 in gold and 15 per cent in lead.——In the Christmas lease of Potvia & Vaine the output last month was 400 tons that averaged $40 to $50.

The find of gilsonite in shipping quantities, in Middle Park, has opened a new industry in that section. The product will give a profit of $6 per ton after being hauled by wagon to Empire and sent by rail to Denver.——The 40-stamp mill of the Gold Coin Mines Co., near Nevadaville, is working on ore from the Indiana and Hidden Treasure mines.——The Hubert mine, Gilpin county, is keeping a 30-stamp mill running twelve hours a day.——Illinois capitalists have organized under the title of the Brunswick G. M. & D. Co., and will operate the Wheaton, Martin and Ettie lodes, located in Lake district, Gilpin county. There is little development done, but enough to show some good ore.——Work on the Bourbon mine, Fall River, has been stopped by the rapid inflow of water at the breast of the 600-foot adit. At this distance the adit has 400 feet surface depth.——The Winnebago M. Co. have purchased, for $75,000, the property of the Gold Area M. & M. Co. near Central City. The property comprised 8750 feet of lode claim, a five-acre millsite and the machinery and tools.——At 85 feet a vein was caught in the Longfellow mine, Cripple Creek, and a twenty-ton shipment of $40 ore made. The Saratoga mine, in Clear Creek, is being persistently developed. The shaft is 900 feet deep. The water is coming in rapidly on the east 600-foot level. Good-sized ore bodies are opened and ready for stoping in the 800 and 900 levels. The ore is shipped to Black Hawk and there is talk of erecting a concentrating plant near the property.——Three mines of the San Miguel section shipped twenty carloads of ore from Ophir. This makes 286 carloads from the district since January 1st, of which the Iron Springs mine has shipped 174.——The output of the Monument, Cripple Creek, was last month 125 tons of $60 ore.——Leadville and Denver capital has taken hold of the Ground Hog mine, in Eagle county. They have secured a lease on the Consolidated interests, and work will soon commence.——Development continues in the Garfield Con., Cripple Creek. In the 30-foot winze from the 310-foot level a 2-inch streak is said to give $1000 per ton. In the fifth level a 6-inch streak of $800 ore is being worked. The daily output is ten tons of $60 screenings and one ton of $700 ore.——Lessees have opened a vein on the Shoo Fly measuring 5 feet in the 100-foot crosscut showing a value of $40 per ton.——At Leadville, W. T. Harris & Co., lessees on the Elk property, report good results. They are taking out about twenty tons per day of iron ore; they are also getting about 150 tons per month of a good grade of lead ore.——Among the new work the lease on the Nisi Prius will be operated on an extensive scale. These people have from 160 to 170 acres in this lease.

A. Hickman has opened a new chute in the old shaft on the El Paso at Cripple Creek. He broke into a vein that carries 2 feet of ore that assays from $20 to $200 a ton. A trial shipment returned $37 a ton.——Shipments from the Foley & Nixon block leases on the Los Angeles of good mill ore were made.——The initial shipment from the Lafayette will consist of three broad-gauge cars of ore, one of which is expected to run in high smelting values.——H. A. Von Hemert is making a thorough examination of the Ironclad workings and hoisting some ore. Twenty men are employed, but work is not yet under full headway.——M. Parsons shipped forty tons of $30 ore from the Shertloff.——The *Evening Telegraph* says of the Portland that the mine in May cleared $100,000.——A carload of ore from the Village Belle mine at Eldora was sampled by the State Ore Sampling Works. The second-class ore returned $246 to the ton, the third-class $62.40 and the fourth-class $23.

A property is being developed at Frisco, in which the veins run from 5 to 20 feet wide. The ore is generally iron and copper, with shoots and pockets of lead running from $10 upward per ton gold. The Victoria, comprising four claims, is opened for over 2000 feet, showing from 3 to 10 feet of ore that runs from $7 to $49 per ton gold. The Copper Queen shows from 1 to 5 feet of ore, assaying from $20 to $60 per ton gold.——The King Solomon tunnel, heading for Peak No. 1 in Ten-Mile range, in 3000 feet gets 2700 feet depth, and cuts sixteen known veins, all carrying pay ore. This property is being equipped with air drills, compressors run by water power.——In the Gregory Gold M. Co.'s property at Black Hawk the leasing company struck 6 feet of mill ore running from $8 to $10 a ton.

E. M. Brown is working six men on the Ben Butler mine near Silverton. He has over 200 tons ready for shipment. The Ben Butler vein is 30 feet wide, and at one point the ore body is 14 feet in width.——Prospecting Copper mountain veins at Cripple Creek has received a new impetus from the improvement in the Lost Lillie, worked by Hankey & Cole. From a shaft being sunk to the southeast of Fluorine and on the strike of that vein they are getting assays as high as six ounces at a depth of 70 feet.——At La Plata the Swiss company struck another body of tellurium ore in their upper workings.——The Columbus mine has put extra men to stoping and sorting ore. They will ship 100 tons of high-grade ore.

A body of free-gold ore was found in the lower level of the Butterfly mine at Ames. The deposit is in 900 feet at a depth of 700.——Killum & Ogilvie at Cripple Creek are shipping from twelve to fifteen tons a day. The first grade runs from $300 to $400 a ton, and the second grade $50.

The Chemung-Belmont, near Black Hawk, is making shipments of smelting ore which are giving satisfactory returns, the last lot giving values of 5½ ounces gold, 20 ounces silver and 6 per cent copper per ton, or a net value of $110 per ton.

Georgetown *Courier*: A large dike of eruptive rock has been struck in the lower level of the Pelican mine, 2000 feet from the surface. The level has been driven a long distance through barren ground. The dike furnishes enough water to run a mill, and comes through the drill holes with such force that it shoots 10 feet out into the drift. The character of the rock is different from that of the dike which has followed the Pelican vein for 6000 feet, being darker and containing a large amount of black mica in minute crystals. The feldspar crystals are altered to kaolin through decomposition. The dike cuts the Pelican vein in two, and probably throws it, but this will not be definitely known until it is crossed. It has been penetrated about 25 feet.

NEW MEXICO.

The El Paso Smelting Co. at Cook's Peak continues work on its Othello and Desdemona properties. A strike was made recently of a large body of copper assaying 18 per cent. The ore heretofore taken out has been high-grade lead carbonates and galena carrying silver, and this is one of the first indications of copper in the camp. The company is averaging shipments of seventy tons per day and is employing a force of over 100 men.

Cooks Peak produces 350 tons of ore per week that averages $25 per ton in silver and lead, making an output of $8750 per week.——The Confidence mine is working seventy men. A large part of the force is employed in development work.——At White Oaks, on the Old Abe mine, the shaft has been sunk 900 feet. The development work alone has more than paid running expenses.

ARIZONA.

The Black Warrior Copper Co., near Globe, is shipping ore from the Montgomery, which is one of the fifteen claims belonging to the company. The ledge is 20 feet wide and the ore is cheaply mined. It averages 15 7-10 copper and is of a character to flux with the ores of the United Globe mines, which company has contracted to smelt it.

J. A. Fleming, Pres. Black Warrior Co., is practically the sole owner. About twenty tons of ore are being delivered to the United Globe smelter daily, at a cost for mining and hauling of $3.25 per ton, leaving a profit of from $10 to $12 per ton. There is said to be enough ore in sight to insure shipments for a year.

A. F. Kent has sold one-half interest in the Sterling mine, near Prescott, to M. S. Taft for $2800.——L. M. Olden and others sold to the Montauri Gold Co. five claims in Cherry Creek district for $26,000.

Prescott *Courier*: At Jones' mill, Chaparral, the fifty-ton cyanide plant and mill are in operation. In the 1300-foot tunnel — which was originally run to tap the Little Jessie and shortening the line of transportation of ore to the mill—a body of porphyry 20 feet wide has been found, that carries gold enough to admit of profitable working in the cyanide plant. The Little Jessie has produced $600,000.——On the Cumberland mine, Pine Flat, a small force is working with good results. At the bottom of a shaft 100 feet in depth 4 feet of $35 gold ore is exposed.——Searles Bros. are working the Eclipse silver mine. They have forty-one men on the payroll. Six men sort the ore, much of which is high grade.

The Blaisdell mine at Picacho is completing its mill and cyanide plant and expects to be producing bullion shortly.——At the Montezuma mines in the Huachuca mountains work is progressing satisfactorily.

The Temple Bar Co. of Mohave county is working sixty men prospecting large hydraulic mining operations.——The McElroy mine of Blakely & Lynch in Mohave county is turning out sufficient ore to supply their mill.——W. Zent has ore in his Longfellow mine, near Prescott, that assays $56 gold per ton from a vein 23 inches wide.

At Clifton a quantity of low grade ores is a desideratum in copper production. Half of the copper produced (twenty tons daily) at Clifton comes from copper ores yielding respectively three per cent and seven per cent. The former is dissolved by sulphuric acids in vats — the copper settling at the bottom from whence it is removed to the furnace and on to the concentrators for refinement. The 5 per cent, 6 per cent and 7 per cent ores are crushed and separated by jigs, distributing four sizes to mills which grind fine and then are concentrated. Sulphide copper ores which formerly were considered an expen-

sive ore to treat are now being worked advantageously and the sulphur, formerly a great hindrance, which had to be expelled by roasting, is now utilized for fuel in pyritic smelters.

The Yuma *Sun* says that the Oro Bell mine, in Yavapai county, which has been worked without profit in years past by several companies, is now turning out concentrates worth $100 per ton. There are twenty-three men on the payroll.——The ore body in the Tennessee mine in Mohave county has increased in width and the ore in value from the 100 to the 200 level. This mine has good ore and plenty of it and an abundance of water.

MEXICO.

The shaft of the New York & Sonora M. Co. at Las Cruces is down 230 feet, and the crosscut at that level develops a strong ledge. A smelter is to be erected at the same place. ——M. Bornio & Co. have sold to M. Sieberling of Peoria, Ill., and associates the Las Planchas de Plata silver mines—a group near Nogales. An eighty-ton reduction plant will be erected.——The Esperanza & Francisca M. Co. at Guacomea employs 100 men. Development work is pushed and good ore produced. The mill is run twelve hours per day.

The Lustre M. & M. Co., operating near Magistral, Durango, contemplates erecting a cyanide plant. The company operates a 40-stamp mill and chlorination works. The property comprises seven claims. The output amounts to 100 tons a day and 150 men are employed. It is a gold producer. The property is owned by Pittsburg people. W. E. Koch is Gen. Mgr.——The Neuva Union Co., near El Oro, has 16,000 tons of tailings on hand. —— F. H. Garcia, near Nacosari, Sonora, has leased La Dirrota mine to an American company, who are to open the property to a depth of 300 feet.

AUSTRALIA.

The gold production of Australia, during the first three months of 1898, was 702,934 ounces, against 543,910 ounces in 1897. For the same period the increase was about $3,000,000.

Personal.

JAS. D. HAGUE has gone from Grass Valley, Cal., to New York City.

STATE GEOLOGIST T. A. RICKARD of Colorado is looking at California mines.

SUPT. BLUNNER of the Murchie mine, Nevada City, Cal., has returned home from San Francisco.

P. A. FUSZ has been elected president Con. Granite Mountain Bimetallic Co., Phillipsburg, Montana.

F. BEAUDRY, a mine owner and extensive operator, Callahans, Cal., is in San Francisco en route home from Paris.

F. F. THOMAS, Supt. Gwin mine, has been elected president of the company, succeeding M. W. Belshaw, deceased.

CAPT. COUCH of Coulterville fame is again in California, looking after some dredging operations in the northern part of the State.

SURVEYOR-GENERAL GLEAVES has returned from southern California, where he recently went to investigate a number of land surveys which were declared fraudulent by a former employe of the land office. The lands in question are in Pine canyon, near Mojave, the San Gabriel forest reservation, and near Calabasus and Johannesburg. Mr. Gleaves declares that he found all of the surveys correct. It is now probable that the claimants will be given title by the Government.

MR. A. S. HALLIDIE left San Francisco this week on an extended tour through the Atlantic slope, his mission being to take notes and observe the arrangement in every way of different technical schools in Eastern cities. Upon his return he will confer with his California colleagues as to the building and arrangement of the Wilmerding Industrial School in San Francisco. It is understood that the bequest was intended, in the language of the testator, "to have a school where boys could learn a useful trade with little study and much work." The school will probably be on a lower plane than the Lick Industrial, but it is the desire of those having the matter in charge to make it of the utmost practical value.

Recent California Mining Incorporations.

Latuya Bay Gold Placer M. Co. of Alaska, San Francisco; capital stock $10,000,000, subscribed $6,303,000; O. O. Savage, T. W. Hobson, A. L. Burbank, J. N. B. Brackett, C. L. Blakemore, Jan Jose; B. Stahl, L. Meyers, New York, W. P. Veuve, Los Gatos, W. S. Gardner, Centralia.

American River Channel M. Co., San Francisco; capital stock $100,000, subscribed $60,000; J. B. Gonyean, J. L. Cooke, L. A. Larsen, N. Fife, H. A. Cooke.

El Dorado Gold Dredging Co., San Francisco; capital stock $1,000,000, subscribed $1000, I. J. Truman, Byron Jackson, L. P. Drexler, W. A. Shahan, S. N. Griffith.

Recently Declared Mining Dividends.

Lillie, Colorado, 1 cent per share, $9000; June 1.

Deadwood-Terra, South Dakota, 15 cents per share, $30,000; May 26.

Tamarack C. M. Co., Michigan, $4 per share, $200,000; payable June 30.

Victor, Colorado, 10 cents per share, $20,000; June 1.

Bix Six M. Co., Colorado, ½ cent per share, $2500; May 25.

Coast Industrial Notes.

—President Diaz recently opened the first electric road in Mexico, connecting the towns of Jalapa, Coatepec and Xico.

—The Sonoma City, Cal., Water Co. has incorporated; capital stock, $25,000, to be used for the construction of a water system at Sonoma.

—During the week Bakersfield, Cal., celebrated with appropriate ceremony the completion of the S. F. & S. J. V. Ry. from tide water to that city.

—Twelve river steamers and five barges started from Seattle, Wash., last Thursday, on a 3000-mile ocean voyage to St. Michaels, mouth of the Yukon.

—Material for the Stockton & Tuolumne County Railroad is arriving at Stockton, Cal., daily. Twenty-one carloads of rails, fish plates, etc., are now there, and twenty-five more carloads are on the road.

—Timely rains give assurance of wheat crop in Washington in excess of 20,000,000 bushels. The bulk of the grain will go to the Philippines, Japan and China. May rains also greatly aided California growing grains and fruits, and in many sections the yield will approximate that of an average year.

—The foundrymen on Puget sound have been paying for years $23 a ton for pig iron that costs in the East $9 per ton. It is locally estimated that this same class of iron can be made on Puget sound for $7 or $8 out of ore that goes 62 per cent metallic iron and low in phosphorus, silica and sulphur—a strictly pure Bessemer ore.

—A Tacoma, Wash., dispatch says: Twelve thousand men, 4000 boats and 10,000 tons of outfits are now leaving Lakes Bennett and Tagish for Dawson and vacating the immense boatyards at the lakes. The price of lumber and boats has fallen. The Canadian Government is opening a waterway between Lakes Linderman and Bennett.

—Last week the U. S. government, being in immediate need of three 12-inch manila hawsers, each 1200 feet long, to be used in towing to the Philippines, placed the order with the Tubbs Cordage Co., with the request that if possible they be finished in a week, with the result that in forty-eight hours after the receipt of the order the hawsers were made and delivered.

—Sweet wine experts have completed their figures relative to last year's output of sweet wines by the wine growers of California, with the following result: Port, 3,158,545.81 gallons; sherry, 2,372,170.33; muscat, 721,555.24; angelica, 748,686.20; tokay, 11,771,99; Malaga, 11,614.56; total season 1897-98, 7,024,344.13; season 1896-97, 4,968,339.21; season 1895-96, 6,083,919 87; season 1894-95, 4,242,600.41; season 1893-94, 4,724,595.62.

—The Northern Pacific Railway has sold thirty-five miles of steel rail to a British-American syndicate for a railway over White Pass between Skaguay and Lake Bennett. The syndicate wants bids for 50,000 ties. Three million feet of lumber have been purchased and many workmen sent north to work on the road. One of the projectors says the line will be in operation to Lake Bennett by Sept. 30th, reducing the freight rates across the pass to three cents a pound.

—A meeting of the Pacific Coast Manufacturers and Producers' Association was held in San Francisco last week to protest against the patronizing of Eastern firms by the Government when the goods can be secured on this coast. The manufacturers claim they have been discriminated against and point to the fact that the shoe factories of this coast can turn out 3000 pairs of shoes a day, at less cost than they can be shipped from the East and a great deal of time saved.

—Neither Schley nor Sampson has yet Deweyized Cervera at Satiago de Cuba, but the warlike character of the present permeating every department is illustrated by the recommendation this week of the Secretary of War to the House of Representatives for funds for harbor defense and other work in carrying on the war, aggregating many millions of dollars. Among other items was a significant brief one recommending an appropriation of $150,000 for torpedo defense of Manila harbor, Philippine Islands, to be available until expended. Other estimates submitted were for a pneumatic dynamite battery at San Francisco harbor $150,000, and for the installation of range and position finders $150,000.

—By September three large cargoes of Australian coal, aggregating 6000 tons, will be landed at Dutch Harbor and Unga island, Alaska, for the larger transportation companies. Three vessels are now loading at Newcastle, New South Wales, for the far northern ports. The British ship Ilala, Capt. Davies, will carry 2500 tons of fuel to Dutch Harbor, and the American bark Empire, Capt. Krebs, will have some 1800 tons. The American bark Palmyra, Capt. Kellar, will carry 1400 tons to Unga island for the Alaska Commercial Co. It is seldom that it is necessary to bring Australian coal to the Alaskan peninsula, but the great demand on Washington and British Columbia mines, as well as the reasonable charter rates, has brought it about this year.

—The Canadian Pacific Railroad Co. is actively pushing the extension into the Boundary, B. C., country. The mine will be 100 miles in length; the estimated cost is $3,000,000. The bids were wired to the head offices of the Canadian Pacific at Montreal. The construction may not be let before July 1. The road will connect with the C. & W. at Robson, thence up the Lower Arrow lake to Dug creek, up this stream to McCrea pass, thence down McCrea creek to Christina lake to Cascade City; along Kettle river to Grand Forks, up the North Fork and Brown's creek to Eholt pass, down Eholt creek to Boundary creek and through Greenwood, Anaconda and Boundary Falls to Midway. The line is difficult, requiring much tunneling and costly bridging.

—Since the days of Dr. Wozencraft innumerable schemes have been projected for the reclamation of portions of that part of extreme southeastern California known as "the Colorado desert." The Lower California Development Co. now proposes irrigation of that region. Estimates are that the entire system can be constructed for $300,000, and that a canal can be built large enough to carry sufficient water to irrigate 1,000,000 acres of land, it to have a natural fall of 330 feet from the point where the Colorado river is tapped to its extreme northern limit in Riverside county. The lands to be reclaimed are situated in San Diego and Riverside counties, and in the northern corner of Lower California. The center of the tract is about 100 miles from the city of San Diego. The acreage of the first-class lands reclaimable by the proposed system of canals is given at approximately 1,600,000—900,000 being in the United States.

—E. H. Coffey, secretary of the Club Internacional of San Diego, regarding the undeveloped resources of Mexico on the Pacific side, says: "The most northern and forming boundary with the United States is the State of Sonora, with a population of 154,532; to the south the State of Sinaloa, 223,684 inhabitants. The Territory of Tepic follows with 125,294 people; below, the important State of Jalisco, containing 1,159,341 inhabitants; then Colima with 69,547, Michoacan 834,923, Guerrero 332,857, Oaxaca 793,419, and, lastly, Chiapas (not counting the Japanese colony) forming the frontier State of Guatemala. South of our own State lies the territorial peninsula of Lower California with 34,668 people; a total of 4,027,756. The two first mentioned States are essentially devoted to mining industries, though agriculture is well represented. Farther south Colima is purely agricultural, while Jalisco to the north and Michoacan to the south, agricultural and mining industries are evenly divided. But the State of Guerrero, whose shipping port is Acapulco, soon to be connected with the nation's capital, is perhaps least developed, and, I have no hesitancy in saying, is destined to be the richest mining section in the republic of Mexico. In 1872, in company with a practical miner, I traveled throughout the length and breadth of the State, even to the ruins near Ometepec, lately spoken of as a recent discovery by Mr. Nevin. In this State the eastern and western Sierras unite, forming a nucleus; in their extended arms their wealth of gold, silver, copper, quicksilver and lead seems to have been concentrated. The whole country is a mass of mineral to such a degree that there are but few streams which are not impregnated with metallic taste. The fearfully broken and harsh face of the country, beseamed with rugged hills and deep chasms, has jealously guarded these treasures hitherto. The transportation has of a necessity been costly in the extreme. Within a very short time the 5000 men now working upon the railroad having concluded the task, the country will take rapid strides, and Guerrero will be the Mecca of numberless mining operators. In 1873, at the instance of the Legislature of Michoacan, the federal government resolved to create a port of entry therein—Maruata was the place to be chosen. In a personal interview with President Lerdo de Tejeda, he commissioned me to examine the locality and report to him as to the most suitable place. In accordance with his instructions, I went to the coast, at that time virgin to the foot of the drummer and the prospector. A month of solitary wandering along the shores of the ocean from the river Coahuayana to the mouth of the Mexcala, showed me that Bucerias was the only fit place—Bucerias was to the north and Maruata to the south, with a few miles intervening. The names were changed about to suit the circumstances and the spirit of the intention. In June the port was declared open and the custom house established, with a personnel of twenty-four employes. Things progressed merrily until the latter part of September, when fearful inundations flooded the surrcunding country, cutting us off from all communications by land. The poisonous emanations from the marshes and forests began their deadly work. The engineer, a Frenchman, was the first to succumb. In ten days eighteen had died; the collector, his secretary and the appraiser fied, and three, among whom I was one, were left to our fate. After an illness and a convalescence which lasted ten months, I sent in reports, according to my promise, of the products of the country. A collection of eighty-eight different varieties of wood, now in the museum of the University of California, which I forwarded in 1873, will in itself give an idea of the forest wealth of that section. Rubber and vanilla, tiger skins and deer skins form a revenue that easily support the Indian from year to year. The coffee, which was taken up as an industry in those times, has to-day developed to such a degree that, as you must be aware, companies are eagerly buying up land in all parts. One single estate, which at that time was known by the names of Montetlan, El Jabali and Sal si puedes, in the State of Colima, was entrusted to me to be sold for $15,000. It now belongs to a wealthy merchant and banker, who has set it out in coffee, and from 100,000 trees he took a crop of 183,000 pounds. There are now about 700,000 trees in. Mr. Vogel was offered $2,000,000, which was not considered."

RECENTLY was noted herein the manufacture of corn oil, with details as to its production in Chicago. It is further learned a substitute for "India rubber" is to be produced therefrom. Sulphur is one of the components, but the process and its elements are still a "trade secret." The New York Glucose Co. is conducting the present experiments.

Took the Prize at Drilling.

A long, lank, brawny-looking man, with a good-natured face and hair as red as the prairie rose, called at the Lawrence-street recruiting office this morning. He walked up to the table and accosted the officer in charge something like this:

"I want to sign my name here, so I kin help clean out the d—n Spanish."

"Have you ever drilled any?" asked the officer politely.

"Yes; I took the prize here at the festival an' cabbaged it, hands down."

"What company were you with?"

"The Cripple Creek Gold Company."

"I don't believe I understand you?"

"Well, you understand English all right, don't you?"

"Yes, but how long have you been a soldier?"

"Thunderin' tunnels, I never was a soldier?"

"But you say you have drilled?"

"That's what I said, but I thought you meant had I ever drilled with a drill in the mines. No, I never was a bluecoat, but I kin outdrill anything in the camp."

They soon understood each other, and the proud old miner passed an examination of 100 before the board of medical examiners.—Denver Times.

Commercial Paragraphs.

SAYS the Denver *Mining Record*, a large consignment of placer pipes for the Bradeck Placer Co. has arrived at Breckenridge. The consignment was from the Risdon Iron Works, San Francisco.

THE Colorado Iron Works Co. of Denver, Colo., has shipped all the machinery for the Randsburg-Santa Fe Reduction Co.'s new mill at Barstow, Cal. The total number of cars shipped was sixteen. The mill will be running in a short time. This same company, through their Salt Lake agent, A. H. Grant, has received an order from the Hanauer Smelting Co. of Salt Lake City for a 42x144-inch smelting furnace.

MR. LEWIS SEARING, consulting electrical engineer for the Denver Engineering Works, in company with Mr. Carlos Riedt of Durango, Mexico, has been making a tour through the mining camps of Colorado examining the latest improvements for the economical mining and treatment of ore. They devoted considerable time to Cripple Creek and vicinity, and before leaving Mr. Riedt placed an order for a large steam and electric power plant, and four of the new hoists manufactured by the Denver Engineering Works. This company has been very successful with their electric hoist, and this order is the result of a very careful examination of the hoists after a test run of considerable duration in Mexico.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR COUPLING.—Charles H. Smith, Coulterville, Cal. No. 604,505. Dated May 24, 1898. This invention relates to a device for the automatic coupling of cars and a means of disengaging the couplings without the necessity of the operator passing between the cars. It consists essentially of bars rigid with and projecting from opposing cars, said bars being on opposite sides of the longitudinal lines of the cars, diverging guides projecting from the cars, one in line with each of the bars, said guides having openings made entirely through them and the bars having knobs which pass through the openings to a point exterior to the inner end of the guides. Shafts are journaled on each car at a point behind the inner end of each guide and weighted arms on the ends of the shafts with plates on the shafts lying just behind the vertical plane of the inner ends of the guides to prevent the passage of the knobs beyond the inner ends of the guides, except by lifting the plates until the grooved portion passes the knob, when the plates will seat themselves against the open inner ends of the guides and partially close the same and secure the knobs.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 24, 1898.

604,694.—SPEAKING TUBE—T. Fales, Bridgeport, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

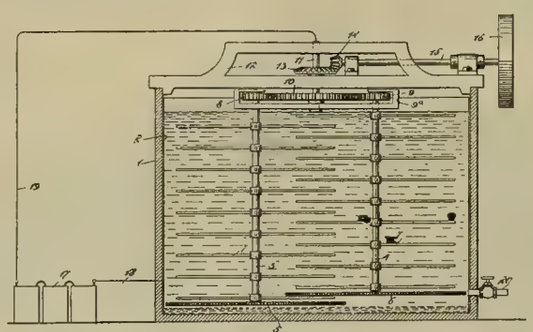
Starters for Gas Engines.

The gas engine, though a more efficient machine than the steam engine, has yet many countervailing disadvantages which have been a great hinderance to its progress and popularity. Some of these, says the *Mechanical World*, are perhaps inherent to its principle; others are not. One of the difficulties with a gas engine is that of starting. A steam engine will usually start when the crank is off the center and the cylinder is warm; the flywheel will carry the crank past the next center, and movement will continue. Not so with the gas engine. In its smaller sizes it is easy to start when in order, because the attendant can pull the flywheel round sufficiently to secure a first explosion, or even help it to the second explosion. But a man unaided is not able to start a gas engine of even moderate power. Gas engine makers have overcome this difficulty by the use of starting devices. These are various, ranging from a store of compressed air pumped up by the engine itself on previous runs, or a hand pumping device to fill the cylinder and exploding by the timing valve, to various other devices more or less simple, and suitable for engines of moderate dimensions. But for large engines there is good reason to doubt the convenience and desirableness of these self-starters, especially of that order which depends upon a stored pressure of air pumped up by the last run of the engine. It seems to the writer that gas engine makers have striven too much after originality, and rather neglected well-established and sound precedent. Until a comparatively recent date, factory engines were never provided with any starting or moving gear, other than the ordinary rack and bar. Engines in pairs were, of course, self-starting, in so far as they were as a rule arranged with cranks at 90 degrees—an old-fashioned arrangement, by the way, which has ceased to secure universal approbation, more especially with compound engines, in the steam distribution of which the 90-degree arrangement is apt to introduce an undesirable element. With the introduction of rope gearing, however, and the growth of the average pair of engines from 500 to 1000 or 1200 indicated horse power, the old barring arrangement ceased to be practicable.

If only to facilitate the putting on of the ropes when the engines were first started, or of new ropes as required, some more powerful means of revolving an engine slowly became necessary, and this was found in the small barring engine—a little pair of engines, as a rule, which were so arranged to gear into an internal toothed ring within the rim of the large rope drum that, when the main engines began to run with their own cylinders, the little engine was automatically thrown out of gear by the overrunning of the large wheel. Every maker of large steam engines applies these small engines, and a large pair of engines is not considered complete without its small barring engine. Here is the complete precedent for the starting of the large powered gas engine. A gas engine, very small compared with the size of the main engine, will be of ample power to turn the large engine slowly round so as to draw in and compress its charge of gas and air and give the first explosion. Such small engines do not even require to be of a particularly economical type. They are required to be themselves set in motion by hand, and to render this easier, the compression may be kept moderate and less dilute mixtures of gas and air be employed. A run of a minute or two is all that is required to turn the main engine to the ignition point. It is not even always necessary that the starting engine should be able to exert a power sufficient to compress the charge in the main cylinder, for the main engine, once set revolving, will have a store of flywheel energy to assist this if gas admission be delayed and the exhaust be open until the flywheel has acquired its maximum desired starting velocity.

This system of starting has the advantage that the flywheel being in motion, the stress upon the crank and other parts will not be so severe as when a first powerful explosion operates upon a piston at rest. For this reason it is well that the starting engine should not be unnecessarily small. The more quickly it is able to revolve the main engine, the less will be the stress put upon this. As with its prototype, the steam-barring engine, so the gas starter may be arranged to throw out of gear when the main engine accelerates under its own energy, and the throwing-out gear may be coupled with a shut-off valve to stop the gas supply, so that the little engine ceases to move as soon as it has fulfilled its duty.

In a central station with numerous engines in line, an obvious method of starting is by a shaft extending the length of the line of engines, and operated by an electric motor or a small gas engine, or an engine may be started by its own dynamo, which supposes, however, a source of electricity. In single engines, and on ordinary work, the small gas engine seems to present itself as the most satisfactory method to adopt. Where poor gas is employed, and mis-fires are likely to occur at starting, the use of a starter of the stored-pressure type might prove exceedingly inconvenient should the store of air be used before a start were effected. With the barring engine, the main engine can be simply kept moving until a fair start is secured. Failures to start may occur, with starting systems involving a piston. This is not likely to occur with a continuously revolving engine, as the loss of pressure is but slow, though sufficient to render ineffectual all attempts to start an engine from rest.



Another New Process.

J. R. Hebaus of Butte, Montana, has a new process for extraction of gold and silver, illustrated herewith.

Referring to the engraving, 1 designates a tank of any desired construction and open at its top, with a lining 2 of amalgamated copper, which constitutes the cathode. Within the tank agitators are arranged. They consist of shafts 3 4, having disks or arms 5 6 at the lower end, of insulated material. Extended radially from the shaft are arms 7, constituting the anode. The shaft 3 is provided at its upper end with a pinion 8, and the shaft 4 is provided at its upper end with a pinion 9. These pinions 8 and 9 engage with a gear wheel 10, mounted on a shaft 11, having bearings on a frame 12, mounted on the tank. Secured to the shaft 11 is a bevel gear 13, meshing with a bevel pinion 14 on a driving shaft 15, to which a drive wheel 16 is attached. The shafts 3 and 4 have bearing at their upper ends in a bar 9ª, mounted to turn on the lower end of the shaft 11.

The cathode or amalgamated copper lining 2 is attached to an electric battery 17, by means of which a wire 18 and the anodes consisting of the shafts 3 and 4 and the arms thereon are connected by a wire 19.

The tank is charged with the required quantity of water, the agitators set in rotary motion. The pulverized ore is then gradually introduced, together with salt, caustic soda and lime in unequal proportions. Ores which carry but little silver do not require salt. Ores which carry silver in quantity require one pound of salt to the ounce of silver. In proportion to one pound of caustic soda is used sixteen pounds of lime. The charge is then ready to receive the chemical solution, which consists of from one-fourth to three-fourths per cent of cyanide of potassium. At the time the chemical solution is introduced the electric current is turned on. Diluted bromine and sodium dioxide are added during the operation, care being taken to have the potassium cyanide in excess and not to add the bromine and sodium dioxide faster than the cyanogen is set free. After the ore is treated from two to three hours the ore and solution are drawn off through the valve-controlled outlet 20, then drawn off into another vat to settle, when the solution is removed from the vessel and used over again, with the addition of a new supply of cyanide.

NEW PROCESS FOR EXTRACTION OF GOLD AND SILVER.

Invention vs. War.

The development of the art of war from this time on will be a battle of inventors. Even our last war was productive of engines of war and destruction which exceeded in number those of the entire world up to that date. The next conflict the chemical patents will vie with the physical. An official is reported to have said, regarding the Maine disaster: "It took just about three men to accomplish the destruction of that gigantic fighting machine. They could, with a large quantity of nitro-glycerine, or some such high explosive packed in bags impervious to water, have accomplished it. By placing in each bag just enough cork to give the whole the approximate specific gravity of the water, dragging one of the bags, a good swimmer could have approached within a short distance of the ship, then dived to escape observation, and come up under the safe shelter of the side of the vessel. To attach the bags to the bottom of the ship would be easy, and a chemical time fuse that would burn under water could be ignited readily enough and time enough for easy escape of the operator." When two or three men with a few dollars' worth of explosives can approach and destroy in a few moments a $5,000,000 ship of war, it would seem to indicate that the real fighting of the future—on the water at least—will be done with smaller and less unwieldy craft.

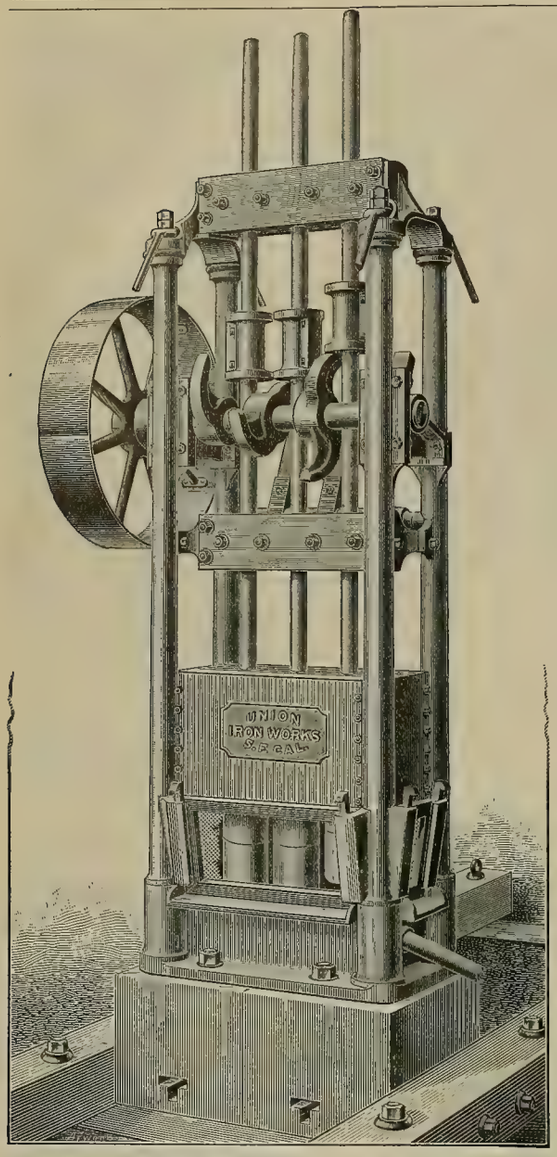
The advantage of high explosives is that only a little power is required to convey them to the place of action, and from experience already had with their destructiveness, it is fair to presume that should a half dozen hostile vessels of war succeed in entering any of our harbors, they would quickly be annihilated, not, perhaps, by our own warships or forts, but by a small group of courageous men with infernal machines.

Nations vie with each other in building the largest warship or the largest gun, the utility of which is based upon gunpowder, yet gunpowder is practically out of date. It has given away long since in mechanical operations, which will, in the near future, be the arbiters in the offensive and defensive operations of nations. The cost of one modern warship will build fifty effective torpedo boats. Whatever the result of the present complications, the stimulus to invention in war craft will, we think, tend to smaller size, with an increase in effectiveness.

Hubernite in Arizona.

A variety of wolframite called "hubernite," a combination of tungsten and manganese, with a little iron oxide, is discovered in quartz veins traversing a coarse-grained granite at Russellville, six miles north of Dragoon, Summit Station, on the S. P. road in Cochise Co., Arizona. It is mixed with white quartz, from which it can be readily separated by ore dressing machinery and other methods. It is nearly seven and a half times as heavy as an equal bulk of water. It is a comparatively rare mineral, but occurs in Cornwall, in Germany, and lately has been imported from Australia. The manufacturers of steel take a great interest in any discovery of the mineral and are willing to pay a good price for it when it is pure and high grade. It should contain at least 10 per cent of tungstic acid, and therefore must of necessity be well purified and freed from all quartz and gangue.

This ore is not in one continuous body. It occurs in bunches at intervals in the quartz. The quantity has got to be determined by sinking shafts and by cutting exploring pits and trenches. The value at the market ranges from $60 to $100 per ton.



The Preparation of Chromium.

Aschermann describes a new method of preparing chromium in the electric furnace. A gastight steel furnace is used in connection with a movable electrode. A graphite crucible is placed in the furnace and in it are placed oxide of chromium and sulphide of antimony, in the proportion of 10 in 23. After the furnace is closed, a comparatively light current, say of 20 to 25 amperes, is passed through the material to be melted. A reaction takes place, attended with development of heat.

The resulting mass consists of a regulus of a chromium-antimony alloy, while the upper part of the crucible has an amorphous mass of antimony oxide, sulphide, etc., adhering to the walls. Repeated melting of the regulus removes every trace of antimony, although it is easier to powder and roast this regulus at white heat, when the antimony is driven off. Chromium has the property of dissolving a considerable proportion of carbon, which separates out as graphite again upon cooling. At about 3600° F. chromium volatilizes.

T. C. TRIPLER of New York is the reputed discoverer of a new process for liquefying air at a greatly reduced cost. The first scientists to produce this product did so at a cost of $2500 a quart. By the new process a 40 H. P. engine is utilized and the product is two to three gallons an hour. The operation consists in compressing air three times in succession to 60, 300 and 2000 pounds to the square inch, and cooling it each time by passing cold water over the pipe in which it is contained. The air is then allowed to escape in a fine jet from the end of the pipe in which it is under pressure, and allowed to expand. It passes along back, over and around the pipe through which it has come. This produces an intense cooling of the gas in the inner pipe. Repeated three times over, this expansion cools the air below the point of liquefaction; it ceases to be a gas and becomes a liquid. As soon as it is released it begins to boil violently until the air about it is raised to the same temperature. Some scientists are disposed to regard the discovery as important.

IT is stated that the setting of plaster of Paris is very much accelerated if the plaster is mixed with a 5 per cent solution of common salt—which may be roughly made by adding a tablespoonful of salt to a pint of water.

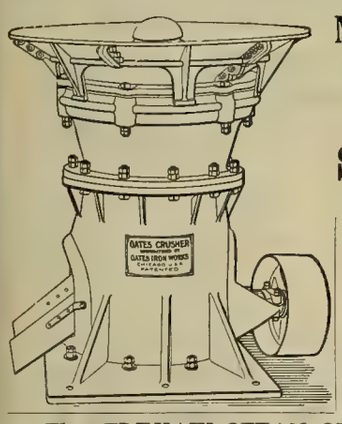
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant



SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

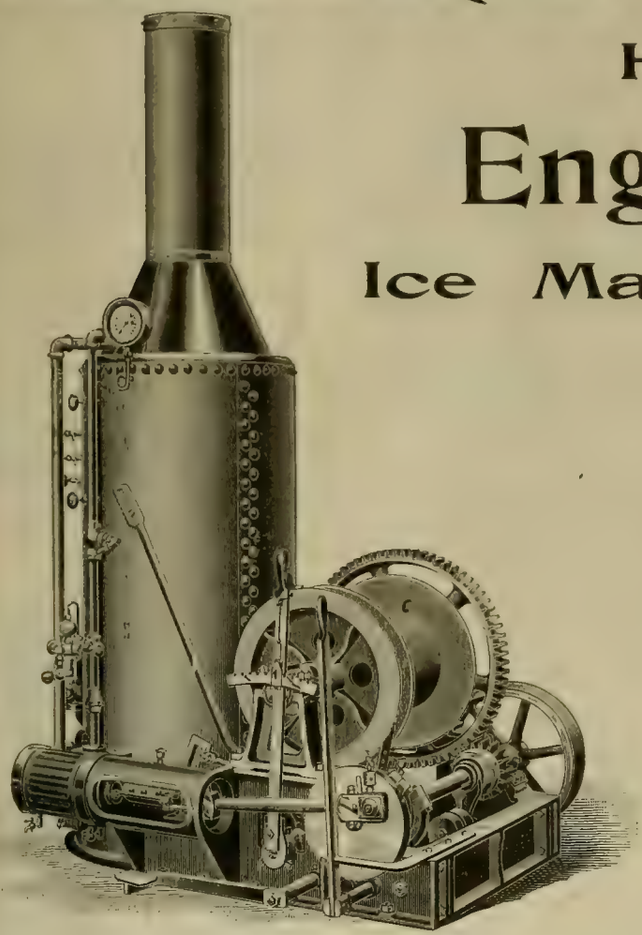
MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

BAKER & HAMILTON,



HIGH GRADE

Engines, Boilers,

Ice Machines,

Mining Tools,

Etc., Etc.

THIS CUT represents our Single Engine **PROSPECTORS' HOIST,** from 6 H. P. up, constructed with sectional iron frame, reversible link motion, improved brake, etc. Engine and Boiler can be disconnected and used for other purposes. Hoist and Engine can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also carry Double Engine Hoists, same type, with or without Boilers, from 12 H. P. up.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WHITE, ROGERS & CO.,

CONSTRUCTING ENGINEERS and MILLWRIGHTS,

Offices: 306 PINE STREET, - - - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

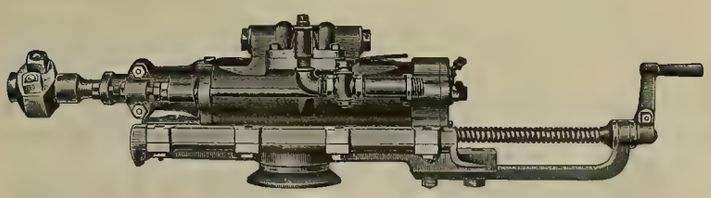
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:



1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The Pelton Water Wheel Company

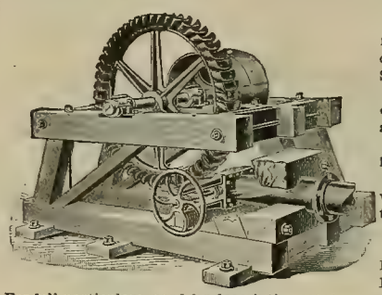
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.



Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

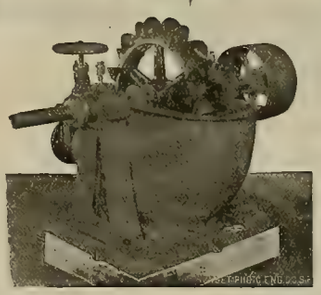
Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHTS' WATER WHEEL.

The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel** of which there are **hundreds in use** in different States of the Union.



These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

Address all communications to **KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.**

For full particulars, send for descriptive catalogue.

TUTTHILL WATER WHEEL.

The Best Jet Wheel in the Market, BARRING NONE.

Wheels, Buckets and Nozzles Designed to Suit Special Requirements. When Head and Conditions Are Given.
Theoretically as Well as Practically Perfect. Highest Efficiency Guaranteed.

We have a Sensitive, Simple Governor that will positively regulate speed of wheel. Specially adapted for electric railway and lighting plants.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Market Reports.

The Markets.

SAN FRANCISCO, June 2, 1898.

Antimony is quoted local at 10c; Babbitt metal 16.18@20c; in general, metals and chemicals are unchanged. Quicksilver is at last week's quotations, $42.50 local. Copper is quoted all round 12c. A San Francisco copper circular says:

The production of copper in 1897 has exceeded any previous year known in the world's history, and were it not that the consumption has equally increased we would have seen lower prices than ordinarily. As it is, we entered the new year 1898 with a stock on hand about the same as that time a year ago. For the first six months the production in the United States was very large, and the demand from Europe kept increasing, so that our exports were much greater than at any previous period. During the latter six months the European demand slackened by reason of the great strike of engineers in England, while the trade of the United States improved so much as to utilize the larger production and leave us at the end of the year with comparatively small stock.

Prices kept very regular accordingly, beginning in January with 11¾c per lb for Lake; an advance was made to 12c, the highest price. This, however, did not continue long, and presently the price receded gradually to 10¾c and improved in December to 11c.

The production of the United States is given by the statistics of the producers, as follows:

	Long Tons of 2240 lbs.
Montana, nearly	100,000
Michigan, Lake Superior	65,000
Arizona	36,000
California, Utah, Idaho, Colorado and New Mexico	12,000
Total	213,000

The exports were 128,269 long tons—over 60 per cent of production, showing a domestic consumption of nearly 85,000 tons—a wonderful increase over four years ago.

This increased production is mainly due to the expansion of electric power, although there has also been a great improvement from uses of bronze in house building, etc.

California has for many years been backward in copper production, owing to heavy cost of transportation, but this past year we have increased at a greater ratio, from the opening up of many old mines that had been lying dormant since the high values of 1864-67. Notably among our products is the Iron Mountain mine of Shasta county, which was purchased by English capitalists and has been worked during the past year on a large scale by smelting operations. In many other sections ore has been produced in increased quantities, and if we only had cheaper fuel for smelting, transportation and power, California would show to the front as a considerable producer of copper. Already one hears of inquiries for copper mines, and some few have been sold, so that there is a reason to expect that 1898 will see a larger production than ever before.

Prices are not likely to improve much, as all over the country it is known that good mines exist only awaiting capital to open them up and improve the facilities for working—by building new roads, railroads, and cheapening cost of fuel and transportation.

The movement of ores, mattes and base metal is given as follows in short tons:

	Short tons of 2000 lbs.
Matte and base metal from California	10,790
Ores from Nevada and Utah	12,616
Ores from Arizona and New Mexico	37,614
Matte and base metal from New Mexico	28,354

In chrome ores there has been little handled owing to the withdrawal of the import duty on same, thereby allowing foreign chrome ores to be imported at a lower rate than California could compete with, with its heavy freight charges to overcome. Manganese, magnesite, and antimony ores have been low and the production here is small. Nickel and cobalt have also shown a decreased production, while lead ores show an improvement, owing to increased values.

Of copper, New York advices are that the copper market is bare of any new feature of great significance, and prices show little if any quotable change. Lake is 12c, with market dull but steady. There is information that the Calumet & Hecla has been shipping copper quite freely since navigation opened a few weeks ago. Exports of this brand have also gone forward lately, although they are small compared with shipments by other exporters. For some time the Calumet & Hecla has been supplying the bulk of the home trade and exporting not more than about a quarter of its production. The Bigelow-Lewisohn group of mines send abroad the large percentage of their output, and since Jan. 1 have shipped to Europe about 35,000,000 lbs. of copper. This assures large earnings for these properties.

Silver attracts some attention. There was a slight general advance in May, caused mainly by Spanish purchases, regarding which *Bradstreet's* says:

Although the influence is necessarily a temporary one, purchases of silver in London by the Spanish government have, it seems, been the chief supporting element in connection with the price of that metal for the past fortnight and possibly for some time previous. The strength of the silver market has been duly noted and was mainly ascribed to renewed Indian purchases caused by heavier shipments of grain from that country, stronger rates for exchange on Calcutta and Bombay and a corresponding disposition on the part of the Indian banks to remit silver. It now seems, however, that this influence has been supplemented by the action of the Spanish government and the Bank of Spain in their efforts to prevent an absolute break-down and suspension of specie payments by the institution in question. The latest advices from Madrid, via London, indicate that the earlier accounts of the run upon Spain's national institution and the drain of its silver holdings were by no means exaggerated. On April 16, immediately before the declaration of war with the United States, it held silver to the amount of 256,980,000 pesetas, or in round figures $52,000,000. At the end of the first week in May the amount was reduced to 146,513,000 pesetas, there having been in the preceding three weeks a reduction of no less than 110,000,000 pesetas, or $22,000,000.

All subsequent indications and advices point to the continuance of the drain, while the proposal of the Spanish ministry to issue a large additional amount of Bank of Spain notes renders it extremely probable that holders of the notes would convert them into silver as long as the bank continued such payments, thereby obliging the institution to go into the silver market on a large scale. The London financial papers, commenting upon the matter, point out that at the latest accounts the Bank of Spain held in gold an amount of 245,338,000 pesetas, or around $50,000,000. By buying silver at the present time it can obtain nearly 2½ silver pesetas for 1 of gold, while the conversion of gold into silver would yield a large seigniorage. It was therefore considered extremely probable a fortnight ago that the financial position of Spain and the methods adopted by the government and the Bank of Spain, irrespective of their effects upon the general financial condition of the country and the gold premium at Madrid, would lead to heavy buying of silver for Spanish account. This has apparently been fully verified by the actual result and has its effect in the sustained higher level which the silver market has exhibited since the beginning of the war. The enemy has, in short, been making a higher market price for an American product.

The interesting story that Gen. Merritt had bought 250,000 Mexican dollars in this city to take to the Philippines is denied.

To-day's quotations on silver were: New York, 59⅝; London, 27⅛d; locally, 59⅜.

Secretary Gage is pushing the coinage of gold bullion at both Philadelphia and San Francisco. Within the past few weeks $30,000,000 in gold bullion has been shipped from New York to the Philadelphia mint. At the San Francisco mint coin is being turned out, though the supply of bullion there is small, not being over $5,000,000.

The Sydney steamer yesterday brought £575,550, which will be received at the Mint, making a little over $2,800,000. Since August 22nd, '97, Australia has sent to San Francisco gold aggregating $22,484,250.

On account of the heavy payments incident to the Philippine expedition, it may be necessary to send gold bullion from the east to San Francisco. Orders have been issued to send 1,000,000 ounces of silver bullion from Philadelphia to New Orleans to be coined into standard silver dollars.

Mining Share Market.

SAN FRANCISCO, June 2, 1898.

Gold Hill stocks were in favor this week, drainage plans being given consideration. Hale & Norcross and Sierra Nevada also showed a little strength. Heaviness characterized the general tone of the market, which was in control of the chippers.

Local mining enterprises paid May dividends aggregating $99,475; in May, '97, the aggregate was $77,025.

300 Chollar	15		

Pat. Apr. 20, 1897; Pat. Jan. 4, 1898.

THE HEDGE GOLD EXTRACTOR, for Quartz Mill Work. A machine at last that takes the place of the apron plates in quartz mills, and will make a saving of 10 to 50 per cent over any other process. Simplicity of construction and operation. Large amalgamating surface and a complete and perfect contact. No scouring; no loss of quicksilver. Can easily be kept clean and in order. Durable, practical and economical. Built in three sizes. Price $150, $300, $400. Capacity 4, 10, 20 tons per 24 hours. Weight 175 lbs, 450 lbs, 600 lbs. PACIFIC MINING MACHINERY CO., 127 First St., S. F., Cal.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Money loaned mines.

Mining companies organized, their property experted, financed and managed.

Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated.

Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

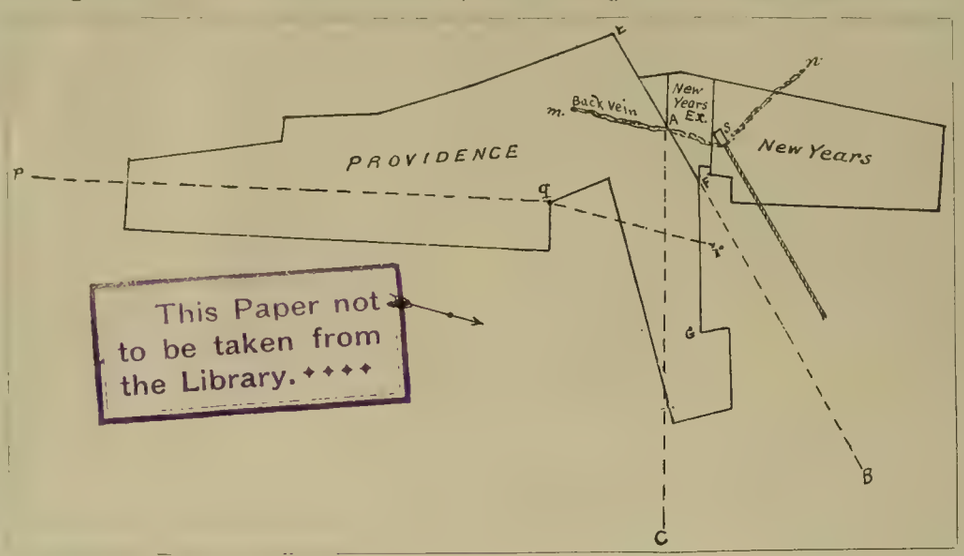
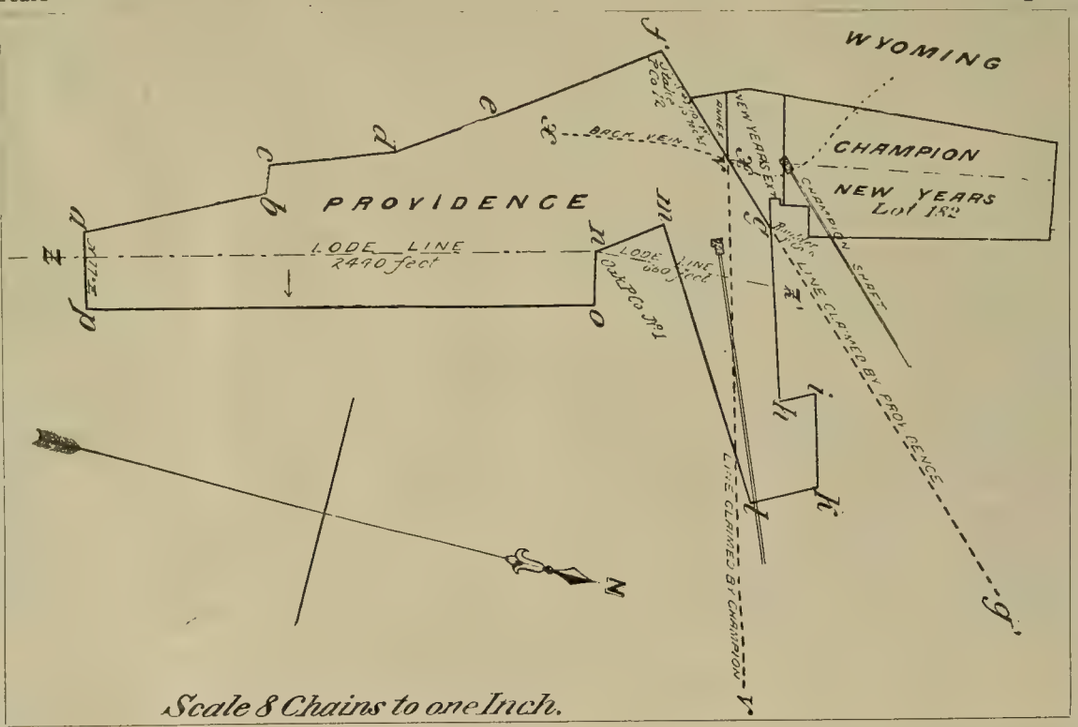
Two Important Mining Decisions.

Since last week's issue, the United States Supreme Court has made final adjudication of two mining cases which are of more than local importance, the question of mining law at issue being of interest to mining men in every part of the nation, hence the matter merits extended notice. The first case was that of A. Walrath vs. the Champion Gold Mining Co., of Nevada Co., Cal., and involved legal questions which it is believed have not heretofore been decided by the court of last resort as to the rights of owners of mining claims held under patents granted under the Act of 1866 as to veins other than the one upon which the patent was granted, as well as to the construction of end lines. Following is a brief history of this case:



A. Walrath was the owner of the Providence mine; the defendant, Champion Mining Co., the owner of the New Years and New Years Ex. claims.

In the year 1870 a patent was granted by the United States to the Providence lode, shown on the diagram at *P*, *Q*, *R*, (Cut No. 1); also to the piece of surface ground marked Providence. On this vein an incline shaft was sunk 1500 feet deep, and extensive mining operations carried on. From this shaft two crosscuts were run 600 feet to the west, and another vein opened up and worked by the Providence Mining Co., this back vein having its apex on the line *M*, *S*, *N*.



On this vein, at the point *S*, the Champion Mining Co. sunk a shaft 1000 feet deep on the pitch, extended its works and took out ore south of the line *E–B*.

The plaintiff asked for an injunction to restrain defendant from working south of the line *E–B*, and for damages for ore removed south of said line, placing damages at $300,000.

The contentions of plaintiff were that whereas the Act of 1866 only granted to the Providence claim the lode *P*, *Q*, *R*., that the mining act of Congress of May 10, 1872, gave it the additional grant of all other veins, the apexes of which were situated within the surface lines of said claim, with the right to follow the same on their dip to any depth, and that the line *E. F.*, which is crossed by the apex of said vein, is the end line on said vein, and that the right to follow said vein on its dip and strike is limited by a plane through said line *E–F* and its continuation.

CUT NO. 1.

CUT NO. 2.—(See next page.)

It was further claimed that a location made by the Champion Mining Co. in the year 1884, containing a clause of abandonment south of the line *E–F*, made said line a compromise line, and that defendant was debarred from asserting any rights south of said line. The defendant contended that the line *E–F* is a line which limits the claim of the Providence mine to said vein on its strike, but that the rights on the dip are limited by a plane passed through the point *A*. and parallel with the line *F–G*., being the line crossed by the patented lode *P*, *Q*, *R*, That the claimed abandonment was not of such a nature as to make the plaintiff a party to same, and that when defendant obtained from the land office the receiver's receipt for a patent, that it gave a new title, which barred any claimed compromise.

The portion of the mine in dispute was that portion of the back vein included in the lines *A–B* and *A–C*. The peculiarity of this action relates to the numerous irregular shaped pieces of surface ground which were patented to mine owners under the Act of 1866 and the application of the Act of 1872 and the decisions of the courts thereunder; the difference between the two acts being that under the law of 1866 a patent was granted for a number of feet of a vein, with a piece of ground for working purposes, which could be taken in any shape. Under the act of 1872 a piece of ground is patented, which is practically supposed to be a parallelogram containing a vein.

The case was tried by U. S. Circuit Judge Hawley of Nevada, sitting for Judge McKenna, in San Francisco in May, '94, and to him submitted for decision on Aug. 13, '94. Judge Hawley rendered his decision in favor of defendant, as follows:

This action is of the same character as the Con. Wyoming-Champion, just decided, and may be said to be a companion case, as it involves the title to a small segment of mining ground of the "contact" vein situate farther south.

The Providence mine was located in July, 1857, in conformity with the local rules and regulations of the miners in the mining district where the claim is located. On the 28th of April, 1871, a patent was obtained from the Government of the United States for 3100 linear feet of the Providence lode and for certain surface ground of irregular shape and form. This patent was is sued under the provisions of the Act of Congress of July, 1866, and the grant was "restricted to one vein, ledge or lode," and to the surface ground particularly described by metes and bounds.

Complainant derives his title to the Providence lode under said patent, as a cotenant.

The respondent is the owner of the mining claims and ground known as the "New Years" and "New Years Extension." Its right to these claims was acquired subsequent to the Act of Congress of 1872, and is evidenced by a receipt and certificate of purchase from the United States Land Office, which is the equivalent of a patent. The original location of the New Years Extension on

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Recent California Mining Incorporations, 624.

its southeasterly side overlapped upon the surface of the Providence mine, in the form of a triangle.

In 1884, the owners of the Providence objected to this overlap upon their patented ground, and the result of this objection was that the respondent caused a relocation to be made by its superintendent, abandoning such portions of the lode and surface ground as were within the patented surface lines of the Providence. The notice of location of the New Years Extension, omitting certain portions, reads as follows: "The lode line of this claim, as originally located and which I hereby relocate, is described as follows: Commencing at a point on the northerly bank of Deer creek, which point is 80 feet S. 11 deg. 45 minutes east of the mouth of the New Years tunnel, and running thence along the line of the lode towards the N. E corner of the Providence mill, about S. 46 deg. 15 minutes east, 3.0 feet, more or less, to a point and stake on the northerly line of the Providence mine patented, designated as mineral lot No. 40 for the south end of said lode line. * * * And whereas, part of this claim, as originally described and as hereby relocated, conflicts with the rights granted by the letters patent of said Providence mine. * * * Now, therefore, so much of this claim, both for lode and surface ground, as originally designated, conflicted or now conflicts with any portion of the surface or lode claims or rights granted by said patent is and are hereby abandoned. Which portion of this claim so abandoned is described as follows: All that portion of the above described New Years Extension claim for surface and lode, which lies south of the northern boundary of said Providence mine which runs north 43 deg. 10 min. east across the southeastern corner of this claim."

Numerous maps, diagrams and models were offered by the respective parties. The diagram (cut No. 2, on preceding page) is deemed sufficient to illustrate and explain the contention of the respective parties:

The lines *a, b, c, d, e, f, g, h, i, k, l, m, n, o, p* represent the lines described in the patent of the Providence. The lode line from *z* to *z'* running in a northerly and southerly direction represents the Providence lode described in the patent. This lode is in granite and is called the "granite lode;" its dip is to the east. The lode delineated on the diagram and marked *x—x'* is a separate and independent lode from the granite, and is called by complainant a "back vein," and by respondent the "contact" vein, between slate and granite walls. This lode is the same as was designated in the Con. Wyoming vs. Champion, as the Ural or "contact" vein. It will be noticed that in its course upon its strike it comes into the New Years claim across the Ural side line—marked Wyoming in the diagram—and passes through the New Years in a southerly direction to the northerly line of the New Years Extension, when it changes its direction to a southerly course and extends through the New Years Extension and across the line *f–g* of the Providence surface line and extends through the Providence ground to the point *x*, as delineated on the diagram. Its direction beyond that point has not been ascertained and is entirely problematical, and, as I think, is wholly immaterial. If it continues in the same direction it would cross the line of the Providence between *d* and *f* near the point *e*; but for aught that appears in the evidence it may extend through the Providence ground and cross the line *a–p*. Its dip, like the Providence, is to the east.

The Providence lode as patented extends northerly about 30 feet across and beyond the line *g–h*, and about —— feet southerly beyond the south line *a–p* of the surface location. No portion of the surface ground is in dispute. There is no controversy with reference to the Providence lode. The only controversy between the parties is in relation to the "contact" or "back" vein. What portion of this vein in its downward course is complainant entitled to? Which line is the northerly end line of the Providence ground through which the vertical plane is to be drawn downward with reference to the contact vein?

Complainant claims that the line *f–g* on the diagram is the northerly line of the Providence with reference to this lode, and that this line should be extended to *g'*, and so on indefinitely downward. Respondent claims that the line should be drawn from the point where the lode crosses the southerly line of the New Years Extension, or annex covering the same ground from *v* to *v'*, marked on the diagram as the "line claimed by Champion."

The case was argued ingeniously, with much zeal, force and ability upon both sides, and numerous questions of both law and fact were earnestly pressed upon the attention of the court in favor of the respective contentions. Many of the points thus presented were—as in the Con. Wyoming case—novel and new, and all of them were exceedingly interesting and have received careful consideration. I shall content myself, however, by stating what is believed to be the proper construction of the Statutes of the United States and announce my conclusions upon the questions involved without attempting to discuss all the legal points advanced by counsel.

As there is no dispute between the parties as to the right of complainant to the Providence lode, it is unnecessary to discuss that question except so far as it may tend to illustrate or explain the principle that is to be applied to his right to the contact vein. The Providence lode was located, as before stated, prior to the Act of 1866, under the rules, regulations and customs of the miners in the district where the mining claim is situated. The locators were only required to designate the lode in their notice of location. The lode was the principal thing. The surface ground was a mere incident thereto for the convenient working thereof. The notice of location designated the number of feet that was claimed upon the lode, and the locators were entitled to that number of feet, if allowed by local rules, in whatever direction the lode run, and to all its dips, spurs, angles and variations. The subsequent Acts of Congress did not interfere with these rights, but were in all respects confirmatory thereof. The Eureka case, 4 Saw., 323; Wilhelm vs. Sylvester, 35 Pac. Rep., 997.

The Act of 1866 provided a method whereby the owners of mining claims, located prior to the passage of the Act, who had complied with these local customs, rules and regulations might, upon certain conditions, receive a patent therefor from the Government of the United States. Parties applying for patents were required, among other things, to "file in the local land office a diagram of the same so extended laterally or otherwise as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor," etc., etc. Under the Act of 1866 parallelism of end lines was not required, but by the Act of 1872 parallelism of end lines is made essential, a survey of the surface ground must be made before it can be patented, and the surface lines of such survey should be marked upon the ground, whether patented under the law of 1866 or of 1872. The intent of both Acts, in this respect, is substantially to the effect that the mining locations made thereunder should be along the lode lengthwise, and the surface boundaries should be marked upon the claim. It was not intended by either Act that the locator would have any right to follow the lode upon its strike beyond the surface lines of his location. The term "location" as used in both Acts refers to the surface ground as well as to the vein or lode. The lode claim, whatever its nature, character or extent, is to be limited to the survey of the surface location, and the title to the lode upon its strike is not given to any portion thereof which departs beyond the surface lines of the location.

In Mining Co. vs. Tarbot, 98 U. S., 463, familiarly called the Flagstaff case, the Supreme Court of the United States declared that under the Act of 1866, as well as under the Act of 1872, the location of a mining claim upon a lode or vein should be made along the same lengthwise of the course of its apex, at or near the surface, and, in the course of its opinion, said: "The Act of 1872 is more explicit in its terms; but the intent is undoubtedly the same as it respects end lines and side lines and the right to follow the dip outside of the latter. We think the intent of both statutes is that mining locations on lodes or veins shall be made thereon lengthwise, in the general direction of such veins or lodes on the surface of the earth where they are discoverable, and that the end lines are to cross the lode and extend perpendicularly downwards, and to be continued in their own direction either way horizontally; and that the right to follow the dip outside of the side lines is based on the hypothesis that the direction of these lines correspond substantially with the course of the lode or vein at its apex on or near the surface." See also Iron M. Co. vs. Elgin M. Co., 118 U. S., 248: The Eureka case, 4 Saw., 323; McCormick vs. Varnes, 2 Utah, 355; 9 Mor. M. R., 505.

The patent to the Providence mine was confined to the Providence lode and to the surface ground as surveyed, and marked on the diagram filed in the Land Office. It granted no right to the owners of the Providence to the "back" vein. It was a grant to the Providence lode only and in express terms excluded a l others. The effect of the Act of 1872 was to grant to the owners of the Providence surface location all other "veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically in whatever course or direction they might run." In Wilhelm vs. Sylvester, 35 Pac. Rep., 997, the Supreme Court of California, in discussing this question, after quoting from Section 2322 of the Revised Statutes, said: "This language is clear and explicit, and, in designating the property rights of locators, is in no wise ambiguous or uncertain. It expressly, and in language which needs no construction, grants to such locators every ledge or lode the top or apex of which lies within the surface lines of the location; that is, such part of the ledge as lies within such lines. And there is no limitation or exception of any such ledge on account of the direction it may run. It may be parallel with the originally discovered ledge, or may approach it at right angles, or at an obtuse angle, or at an acute angle; it may intersect it or not, and still it may be clearly within the language of the said section."

The Act of 1872, in granting all other veins that were within the surface lines of previous locations, did not create any new lines for such veins, nor invest the court with any authority to make new end lines for such other veins. And it is apparent, from an examination of the statute, that the court has no power to make a new location for every vein that may be found within the surface lines of the location and thereby enlarge the rights of the original locators.

When the end lines of a mining location are once fixed, they bound the extra lateral rights to all the lodes that are thereafter found within the surface lines of the location.

It necessarily follows that the end lines of the Providence survey must be considered by the courts as the end lines of any and all other lodes or veins which do "inside of such surface lines." Otherwise endless confusion would arise in the construction of the statute. End lines would have to be constructed in different directions if the separate lodes or veins found within the surface lines did not run parallel with each other, and the result would be that these lines extended might give to the owners of the claims a greater length along the lode as it extended downward than they had upon the surface.

If the same end lines which bind the extra lateral rights of the Providence surface survey apply to the contact vein and to all other veins, if any are hereafter found, then no such difficulty can arise. This is the rule that applies to all locations made after the Act of 1872, and it ought not to be presumed that Congress—by its grant to prior locations intended to give greater rights to them than were given and granted to subsequent locators under the same Act.

It is settled by the decision of the Supreme Court of the United States in the Iron S. M. Co. vs. Elgin M. Co. that the same end lines bound all extra lateral rights as to all veins or lodes within the surface boundaries of the claim. Justice Field, in delivering the opinion of the Court, speaking of the rights of locators to mining ground to follow the lode in its depth, said: "It often happens that the top or apex of more than one vein lies within such surface lines, and the veins may have different courses and dips, yet his right to follow them outside of the side lines of the location must be bound by planes drawn vertically through the same end lines. The planes of the end lines cannot be drawn at right angle to the courses of all the veins if they are not identical."

In the present case the end lines of the Providence—*a–p*, and *g–h*—are conceded to be substantially parallel with each other, and that the Providence lode in its course lengthwise passes these end lines. Complainant's contention would take the "back" or "contact" vein outside of the plane of the northerly end line of the Providence drawn downward vertically and give to him extra lateral rights not granted by the patent nor given to him by the granting provisions of the Act of 1872.

But, in this connection, it is argued by complainant that respondent is estopped from asserting any claim to any vein or lode lying southerly from the line *f–g*, because (1) in its relocation of the New Years Extension claim it recognized and designated that line as the "northerly end line of the Providence line," and expressly abandoned all that portion of the original New Years Extension claim "for surface and lode which lies south of the northern boundary line of said Providence mine, which runs north 43 deg. 10 min. east, across the southeastern corner of this claim;" (2) Testimony was offered and admitted against the objection of respondent, tending to show a further estoppel which was to the effect that before the Champion shaft was started the plans therefor were submitted, by the then superintendent, to the Board of Directors of respondent and approved by it, and that the shaft was sunk, in pursuance of such plans, parallel with the line *f–g*, extended in the direction of *g'*, and that the superintendent had conversations, about that time, with complainant and his brother—a co-owner in the Providence—and stated that he would never interfere with that line and would never cross it, and that this line was practically agreed upon by them at that time as the boundary line between the two claims.

This testimony, giving it full scope and effect, is not sufficient to create an equitable estoppel.

The corporation is not bound by such declarations of its superintendent made without the scope of his agency or authority from the corporation. If respondent was given the line for which it contends it would take that portion of the lode which it expressly abandoned by its relocation. The abandonment, which is binding upon it, was to any and all lodes within the surface boundaries of the Providence location and survey; but this abandonment or agreement—or whatever it may be called—did not give the Providence any greater rights than it previously had. The acquiescence and agreement between the parties amounted to nothing more than a recognition of both parties that the line *f–g* was the boundary line between the two companies.

There is nothing in the facts of this case which gives to complainant any right to extend that line—as a boundary line—any farther than to point *g*, at which point it comes to the line *g–h*, which, as before stated, is the northerly end line of the Providence surface location, and beyond which, in a vertical line drawn downward, the complainant had no right to any part or portion of the "back" vein either by virtue of the Providence location, patent, Act of 1872, or any agreement or estoppel between the parties. Let a decree be drawn designating the boundary plane fixing the rights of the parties in conformity with the views expressed in this opinion, for a perpetual injunction, and for an accounting, if so desired; each party to pay their own costs.

In July, 1895, the case was appealed from Judge Hawley's decision to the U. S. Circuit Court of Appeals in San Francisco. In Cut No. 1 the line *E–F–B* is the one claimed in the original suit by the Providence; the line *A–C* is the one claimed by the Champion; the line *F–G* shows the boundary fixed by Judge Hawley in the decision from which appeal was taken. The United States Circuit of Appeals affirmed the decision of the lower court. The case was again appealed—this time to the highest tribunal in the land—which has just affirmed and made final the two former decisions.

The second case is also one of general importance. In this case the United States Supreme Court last week refused a writ of review to the Carson G. & S. M. Co. of Nevada Co., Cal., which was asked for by that company in its litigation with the North Star Mining Co. The Carson City G. & S. M. Co., owning the Irish-American mine at Grass Valley, Cal., brought suit against the North Star Co., alleging trespass, asking for an injunction and $825,000 damages. In the Circuit Court of the U. S. for the northern district of California, Judge Beatty, in March, '96, decided in favor of defendant. As in the case of Walrath vs. the Champion, the question in course of appeal finally reached the Supreme Court of the United States. The matter is deemed of sufficient importance to reproduce Judge Beatty's decision. It is the following decision that has just been sustained by the Supreme Court. Herewith is also presented a map which graphically illustrates the points in controversy:

This is an action of trespass brought by the plaintiff, as owner of the Irish-American mining claim, situated in Nevada county, California, against the defendant, which, as the owner of the North Star claim, has followed and worked its ledge upon its descent under the surface of the former claim. Each claim is a consolidation of a number of small claims, many, if not all, of which were located long prior to the enactment of any mining law by Congress, and is patented in the irregular shape and of the unusual size represented upon the following plate—the Irish-American being about 1500 feet square, with a strip extending from the main body about 600 feet east, and the North Star, lying 300 to 400 feet south, is about 3100 feet long from east to west and 650 to 1250 feet wide.

The plaintiff's theory is, that the apex of the "North Star" ledge runs so near northwesterly and southeasterly that if continued in its course it would cross the side lines, 1–2 and 3–4 of the claim, but that the ledge in its northwesterly course, before reaching the north side line, is interrupted by a nearly perpendicular north and south fissure or at least a distinct line of change in the geological formation of the country, called in this case a "crossing," to the west of which the ledge does not appear either upon the surface or in the underground workings. The defendant claims that the apex of its ledge runs in an easterly and westerly direction from end to end along the center of its "North Star" claim, and that its dip is northerly or practically in the direction of its main working shaft, and, while admitting the existence of the "crossing," affirms that the ledge continues to the west of it. The surface of the claim is so covered with soil, and any outcroppings of a ledge that ever may have existed are so obliterated by past mining operations, that very little can be determined by surface indications of the course of the ledge. Perplexity is added from the fact that over much of the surface there are many old mining shafts and workings in which more or less ore has been found and which are in such relative positions that they are no guide to the location of the course of any ledge. A portion of them are represented on the plat by dots and crosses.

(1). During the trial plaintiff objected to defendant's evidence based upon the North Star claim as patented, and insisted that the claims of which it is composed should be shown as originally located, and that the rights of the parties should be governed by the located lines of those claims and not by the patented lines of the North Star. This objection was overruled, and as upon final argument plaintiff insisted upon its objection, a brief consideration of it will precede any discussion of the other issues.

In this objection are involved the questions of the parallelism and of the intersection by the ledge of the end lines of the original locations. When those locations were made there was no law requiring such parallelism, but independent of all lines the right to follow the ledge along its course for the full distance claimed, and underground upon its true dip to any depth was undisputed. Although Section 9 of the Act of 1872, in repealing certain parts of the old law, provided that "such repeal shall not affect existing rights," the courts have held that when any claim is patented those rights are controlled by the patented lines. If, however, plaintiff's objection could so far prevail that defendant should be compelled to rely upon the original claim as located, instead of upon the North Star patent, it ought to follow that they should be considered as unpatented claims, and all rights which attached to them prior to patent should accrue to defendant, for manifestly it would be unjust to deprive defendants of all benefits arising from its North Star patent, as well as those which attached to the original location while unpatented. Moreover, the defendant, owning the several claims which now compose the North Star, might have procured separate patents for each claim, and in doing so might have so changed the end lines as to make them parallel, just as is always done now in application for patent, and if the several claims jointly included the entire apex, all the claims could have been so surveyed as to make all the end lines parallel to each other, and thus give it what it now substantially claims by its North Star patent. The defendant has done by one act, at less expense, what it lawfully might have done by several acts at greater expense. The North Star patent is of greater superficial area than any law has ever authorized for a single ledge location, but it has been held by the Supreme Court that, while the law prescribes a limitation to the size of a single location, there is no limitation to the number of claims one person may hold by purchase or that he may include in a single patent, and, as I understand, that may be included in a single survey showing only the exterior boundaries and omitting all interior lines of the several smaller claims. Such was the holding as to agricultural lands in Polk's Lessees vs. Wendell, 9 Cranch, 87, and as to placer claims in Smelting Company vs. Kemp, 104 U. S., 636. There appears no reason why the same rule should not apply to quartz claims. Independent, however, of the foregoing consideration, a patent has been granted for the North Star claim. It has passed beyond the field of discussion that a patent can not be collaterally attacked on account of any question which the land department could lawfully determine before issuing it. Without now defining what questions are settled by the issuance of a patent, it is held that the question of the defendant's right to a patent to the North Star, with the boundaries as defined by it, was within the jurisdiction of the department and was determined by it, from which it is held to follow that the boundary lines as defined by the patent are the only lines by which the rights of the parties can be determined. To adjudge such rights by the original lines of the several claims of which the North Star is composed would be such an assault upon the patent as cannot be sustained. The former ruling upon plaintiff's objection is, therefore, adhered to.

(2). Without making special reference to the testimony of the several witnesses as to the location and course of the apex, it may be concluded, as clearly established, that a ledge had been found in

a number of the group of old shafts existing near the south side line of the North Star. Upon one of the plaintiff's maps is indicated a line of shafts running east and west which is marked "shafts on apex." Plaintiff's witness, Huguniu, was on the ground the day this ledge was discovered in 1851, and located a claim running west from the main shaft, and he fixed a point, designated "C" on the plat, being over 100 feet westerly from the mouth of the main shaft, as within his claim and as the most westerly cropping of the ledge. He also located the apex of the ledge 50 feet south from the mouth of the Larimer shaft and 40 to 50 feet south of the old powder house, which was on a direct line connecting the mouths of the main and Larimer shafts. An apex running through these three points fixed by this witness and continued in its own direction each way would cross the south side and west end lines of the North Star, and the same result would follow to pass a line through these points and the group of shafts. I do not think that from a fair consideration of all the plaintiff's evidence it can be concluded that the source of the ledge is across both the side lines. On the contrary, defendant's witnesses locate the apex easterly and westerly near the center line of the claim as indicated upon the plat, and the witness Morse located croppings at a point designated "B," being about

better guides to the course of the apex than those far below. Plaintiff admits that there is a mineral vein along the line claimed by the defendant as the apex, but says it is but a spur or seam from the ledge which runs elsewhere, its exact locality not being fixed. That this is but a spur or seam of a ledge, and so important that it cannot be made the basis of a mineral location, cannot be reasonably concluded when it is remembered that the first locations were made upon and along it. However, the law fixes no limit to the size or prominence of a mineral-bearing vein before a mining location can be made upon it. While in the group of shafts referred to, a ledge was found; its apex or the course of the apex has not been located unless it be by the plaintiff's testimony concerning the "shafts on apex" before named, and it has not been shown that any vein crosses or is found beyond the south side line. It is not impossible that the apex of whatever vein exists at this place, if traced out, would assume a course somewhat corresponding to the outline of the group of shafts and running in a northeasterly and a northwesterly direction until it unites with the other line of apex, and that the two outcrops or ledges are but parts of one vein which are separated by a large "horse," which defendant's evidence and diagrams show exists near the surface of the mines. There is some

derground rights? That the end lines are not parallel, cannot be the basis of an objection, because their convergence when extended in the direction of the dip of the vein would give defendants less, instead of more, than the law provides for.

Attention has not been called to any precedent in which a ledge is abruptly terminated on its onward course, as is claimed occurs in this case, but a similar principle is involved when a ledge passing through an end line is terminated as to the claim, by going through and out of it, across a side line. Under such circumstances it has been held that the ledge may be followed on its descent between the perpendicular plane drawn through such intersected end line and another similar parallel plane passing through the point where the ledge crosses the side line. Last Chance M. Co vs. Tyler M. Co., 61 Fed. 560-564; Wyoming vs. Champion, 63 Fed. 511-546; Del Monte M. Co vs New York M. Co., 66 Fed. 212; Fitzgerald vs. Clark, Pac. —, which I followed in the last hearing of Last Chance vs. Tyler, — Fed. —. When the last case was first before the Circuit Court of Appeals, that Court said: "If the lode in question, instead of extending into the Last Chance location, had abruptly broken off within the surface lines of the Tyler near the point where, in fact, it crossed the line, there could certainly be no question as to the right

300 feet west from the mouth of the main shaft, and he says that he and his associates located ten claims running west from the Auburn road, "as near as we could tell on the line of the ledge." Defendant's witnesses are corroborated by other established facts: (a) Before the surface was disturbed, and when indications of the ledge were clearer, the original locations were made upon an east and west line and about along the central line of the North Star. (b) The workings of a mine made in mining operations, and not in support of litigation, are generally important as evidence of any facts which may be legitimately inferred from them. The three incline working shafts were started upon this North Star central line and are all shown to follow the ledge in their descent. It is reasonable to presume they were started upon or near the apex of the ledge. (c) The working levels in this case are not so conclusive as usual of the course of the ledge, for the reason that there are large "horses" in the mine to the upper and lower surface of which the workings have conformed, which largely accounts for the varying directions the levels have taken. A majority or many of the upper levels are nearly parallel with the north side line, while others, if prolonged, would cut the west end and south side lines, and still others would cross both side lines, and especially those in the deeper workings. But as ledges may in their depths change their course, and as the surface course or the course of the apex is to govern the miners' rights, the workings nearest the surface are

evidence, at least, to show that two veins do unite in the workings not far below the surface.

From a full consideration of all the evidence, it is concluded that the first mining locations were located along the central line of the North Star claim; that such line is practically the line of the apex of the ledge in controversy; that it has been fixed at different points along the irregular lines indicated upon the plat between the letters "C and D" and running in a direction south about 80° east.

(3). Generally when a ledge has been traced for such a distance in a claim of this size it would not be an unreasonable presumption that it would continue in the same direction far enough to cross the end lines of the claim. This presumption may be indulged as to the east end line, but as before stated, plaintiff asserts that it does not, either on the surface or underground, pass west of the "crossing," which contention is sustained by the testimony, while that of the defendant is to the contrary. Underground there may be some indications of a ledge west of the "crossing," but little if any ore has been found there and the workings of the mine, with some unimportant exceptions, sustain plaintiff's contention. Upon the surface there is nothing shown by which to definitely locate the line of this "crossing." Conceding, however, that the ledge intersects the east end line, from which it extends no farther than about 2200 feet westerly to the point "C," fixed by the witness, Morse, as the place where he found the croppings of the ledge, what are defendant's un-

or the Tyler to follow the lode or vein in its downward course for its entire depth outside of the vertical planes drawn through the side lines. The fact that it continued its course and crossed the side line does not in any manner change this principle. In either case the locator is entitled to the same rights. In such cases the end lines are not necessarily those which are marked on the ground as such. An end line may be drawn at the point where the lode abruptly terminates within the surface lines or at the point where the apex of the lode crosses the side line of the surface location. 54 Fed., 292. It is therefore concluded that the defendant may follow its ledge on its descent under the Irish-American claim and to any depth between a perpendicular plane drawn through the east end line of its claim and another similar parallel plane crossing such claim at the point fixed as the western terminus of the ledge, being designated by "C" and westerly from the east end line 2200 feet, measured along the straight central line upon the plat and along the like line upon defendant's exhibit 8: *provided*, that defendant shall in no event pursue its ledge west of a perpendicular plane extended through the west end line of its claim, and judgment for the defendant is ordered accordingly.

There was another question suggested, but as it was based upon the theory that the course of the ledge was such as would carry it across the side lines, which I cannot adopt, it will be unnecessary to consider it.

BEATTY, Judge.

Some Notes on the Recovery of Gold from Cyanide Solutions.*

S. C. COLES.

One of the chief difficulties appertaining to the economical recovery of gold from weak cyanide solutions by electrolysis has been the electrodes.† If several lead anode sheets are cut superimposed, the strips cling together, and have to be carefully spread out one by one, so that the surface may be exposed to the solution. A clean-up is made every seven or eight weeks when the wood frames carrying the lead strips are withdrawn, the lead strips removed and new substituted, the auriferous lead being ultimately melted down and conveyed to a central works to be cupelled. This method is both crude and expensive, the labor of fitting the strips into the frames is considerable, and the consumption of lead is a considerable item, having been computed by Mr. Von Gernet at the Worcester mine at $\frac{1}{10}$ of a penny per ton of ore treated and by Mr. Williams, at the Crown Reef Gold Mining Co., at $\frac{1}{15}$ of a penny.

The cathode should fulfill the following conditions:

1. The gold should be adherent during the process of deposition.

2. The gold should be capable of being readily stripped after removal from the electrolyzing cell.

3. The cathode should be electro-positive to the gold in solution to ensure the cathode being coated with gold on immersion.

These conditions are fulfilled, I find, by substituting an aluminum cathode for a lead one, advantage being taken of the fact that a loose film of oxide is very rapidly formed on aluminum, the difficulty in soldering and electroplating aluminum for this reason being well known. The substitution of aluminum for lead foil, or strip, enables the gold to be obtained as pure gold and daily returns to be made of the amount of gold recovered. It also has the additional advantage of reducing the cost of labor and economizing the amount of cyanide of potassium used, as the solution is not contaminated by any base metal such as zinc. The deposition of gold from a cyanide bath on to an aluminum plate proceeds in a uniform manner, but in such a way that the gold is deposited as a metallic sheet, which is easily detachable when desired from the aluminum cathode by stripping, peeling or rubbing almost as soon as it is formed; and if the aluminum cathode consist of a sheet of the metal fixed to a revolving drum or cylinder, by varying the rate of rotation, the film of gold can be brushed or removed from off the cathode continuously, so that the process is an automatic one, resulting in the immediate and continuous recovery of the gold without any subsequent cupellation of the lead as in the older electrolytic process.

The process has, therefore, in it the elements of economic working, coupled with the quick recovery of the valuable gold. In the Siemens-Halske process the lead cathodes remain some weeks in the bath; and the gold, which only then amounts to about one-tenth the weight of the cathode, is only recoverable therefrom after a second further operation of smelting and cupellation. In the Siemens-Halske process lead was chosen as the cathode, as it has the property of allowing the gold to adhere to it. In the aluminum process, aluminum is used as the cathode, as it permits of the easy removal of the gold film. In the former process the gold has to be won from the lead by a secondary operation; in the latter the gold is directly obtained in the form of a pure foil without any further expense or trouble. Gold by this process has been successfully extracted from cyanide solutions containing only .01 per cent of cyanide of potassium and 2½ dwts. of gold to the ton of solution. The best results are obtained when the solution is raised to a temperature of about 100° Fahr. It is also found advantageous to use a greater current density with the necessary increased voltage when the aluminum plates have been freshly placed in the solution, so as to ensure their being covered with a film of gold as quickly as possible, otherwise there is a tendency for aluminum hydrate to be formed. In about ten hours an extraction of 95 per cent was obtained by the use of aluminum cathodes, the amount of gold in solution before electrolysis being 2½ dwts. to the ton of solution and the strength of cyanide .01 per cent, and the rate of flow about 15 gallons per 100 hours for every cubic foot of electrolyzing cell, or three square feet of cathode service. Gold has been deposited on aluminum cathodes from solutions containing only .0075 per cent of cyanide of potassium, the current density per square foot being .03, and the E. M. F. at the poles of the generator 6 volts.

The following are the results obtained from gold cyanide solutions of varying strengths with aluminum cathodes and iron anodes:

First Experiment.—A cyanide solution containing 3.2 grammes equals 2 dwts. gold per gallon and 22.71 grammes per gallon of potassium cyanide, or .5 per cent solution, was electrolyzed. The aluminum cathode had an area of half a square foot, and two similar sized iron plates formed the anodes, placed 1½ inches from the cathode, the amperage being 1.50 and the voltage 1.40 at the terminals of the electrolyzing cell. The gold began at once to deposit on the aluminum cathode as a bright coherent coating, and the deposition was allowed to continue for fifteen minutes, when the amperage was found to be 2.0 and the voltage 3.40. The layer of gold could be completely and easily detached by rubbing gently with a piece of indiarubber tubing fixed on a glass rod. A fresh cathode was then inserted:

	P. M.	Amperes per sq. ft.	Volts.
Time of immersion	1:05	3.10	4.40
Taken out	1:20	3.20	4.60

The gold was removed from this cathode and a fresh one inserted without changing the conditions.

Taken out	1:50	2.60	4.70

As gold still continued to be deposited, the experiment was continued:

Time of immersion	2:20	2.80	4.70
Taken out	2:55	2.60	4.80
Time of immersion	3:00	2.30	4.60
Taken out	4:00	2 20	4.90
Time of immersion	4:15	2.60	4.90
Taken out	5:15	2.00	4.90

The whole quantity of gold recovered in these six experiments was well washed to remove traces of potassium cyanide and then weighed.

	Grammes.	Per cent.
Gold added	3.2000	100.00
Gold found	2.7108	84.70

It will thus be seen that 84.70 per cent of the total gold was recovered from the solution in 3 hours 35 minutes, using an average amperage of 2.51 per plate, or a current density of 5.02 amperes, and an average voltage of 4.63.

Second Experiment.—In this experiment a weaker solution of potassium cyanide, containing 11.35 grammes per gallon, equals .25 per cent solution, was employed. The percentage of gold was nearly doubled, viz: 91 grains equals 5.94 grammes, equals 3.80 dwts. per gallon.

The experiment was divided into two portions, the yield of gold at each stage being determined.

	Amperes per sq. ft.	Volts.
1st Stage—Time of immersion 11:15 A. M.	3.60	4.75
Taken out 1:05 P. M.	2.00	5.10
2nd Stage—Time of immersion 1:20 P. M.	2.10	4.90
Taken out 3:40 P. M.	2.00	4.80

The experiment had to be discontinued at this stage, owing to a short circuit taking place within the cell. The gold recovered was:

1st Stage, in 1 hr. 50 min., 3.005 grammes=50.59 per cent.
2nd Stage, in 1 hr. 20 min., 0.875 grammes=14.73 per cent.

A total quantity of gold amounting to 65.32 per cent was therefore recovered in 4 hours 10 minutes, although it will be noted that the greater part of the gold was deposited in the first two hours.

Third Experiment.—A solution containing 6 dwts. of gold per gallon and 32.71 grammes of potassium cyanide, being .5 per cent solution, was employed.

The gold was deposited in three stages and weighed separately, as follows:

	P. M.	Amperes per sq. ft.	Volts.
1st Stage—Time of immersion	5:30	6.25	4.30
Taken out	6:00	5.20	4.10
Gold deposited, 2.930 grammes=32.02 per cent.			
2nd Stage—Time of immersion	6:12	4.80	4.10
Taken out	6:45	4.20	4.30
Gold deposited, 1.340 grammes=14.68 per cent.			
3rd Stage—Time of immersion	6:55	2.20	2.30
Taken out	8:45	2.10	2.30
Gold deposited, 2.055 grammes=22.46 per cent.			

There was thus recovered 69.13 per cent of gold in 3 hours 33 minutes, and the greater part was also deposited in the first half hour, viz., 32.02 per cent.

These experiments demonstrate that the process affords a quick method for depositing gold from its cyanide solutions, and also show that it is easy to remove the film of metallic gold from the aluminum cathode by mechanical means.

In another experiment some gold tailings were carefully assayed and found to yield a button of gold equivalent to 1.4 grammes gold per 1000 kilograms, or, approximately, 1 dwt. per ton.

The quantity of tailings used for the experiment was ninety pounds. This quantity was placed in a suitable vat and treated by the well-known methods for extracting the gold by means of a cyanide solution. The tailings were first leached with a weak caustic soda solution containing four ounces caustic per ton of water; and, after its removal, a cyanide solution containing .5 per cent KCN was added. This solution was allowed to leach the tailings for several hours, and was then drawn off into an electrolytic vat. The tailings were then leached dry for some hours, in order to ensure the complete solution of the gold, and the double cyanide so formed was leached out with a weak cyanide solution containing .18 per cent KCN. After this solution had been drawn off into the electrolytic tank the last traces of the gold solution were washed into the vat with water. The time occupied for the whole operation was 50 hours, so that it represented the same time as is used in actual practice on a commercial scale. The total amount of liquors obtained in this way and submitted to electrolysis amounted to about 50 litres, or about 11 gallons, or about half the weight of the tailings treated.

From the above assay the theoretical quantity of gold which should be extracted from the above weight of tailings is .056 gramme, or one-thirtieth of one dwt. On submitting the solution to electrolysis a current of .29–.31 ampere was employed, at a pressure of between six and seven volts. As the area of the aluminum cathode was approximately one square foot, the current density corresponds to the amperes. The electrolysis was allowed to proceed for seven hours, and at the end of that time the gold was seen covering the whole of the cathode as a very bright golden deposit of extreme thinness. Notwithstanding the thinness of the film, it was found possible to detach it mechanically.

*Institution of Mining and Metallurgy.

†The cathode is usually lead and the anode iron; but in Mr. Andreď's process he has reversed the order, the anode being peroxidized lead plates and the cathode iron.

A Mine Lease.

"I want a good blank form for a mine lease," is a request occasionally received at this office. In a general way it is believed the following is one that may fit. It is "iron-clad" and a little one-sided, but those provisions can be crossed out or waived. It is a form in use by many mining companies that let their property to leasers:

This indenture, made this ..... day of ....., 189.., between The ..... Mining Company, a corporation in the State of ....., doing business in the county of ..... and State of ....., lessor, and ...., lessee or tenant:

Witnesseth, that the said company, the lessor as aforesaid, for and in consideration of the rents or royalties, covenants and agreements hereinafter mentioned, reserved and contained, and by said lessee stipulated and agreed to be paid, kept and performed, has granted, demised and let, and by these premises does grant, demise and let to the said lessee, upon leasehold only, for the purpose of mining in the manner hereinafter set forth, and not otherwise, to have and to hold unto the said lessee or tenant for the term of ..... months, from the date hereof, expiring at noon on the .... day of ....., 189.., unless sooner forfeited or determined through the violation of any covenant hereinafter against the said tenant reserved: All the following described mining property, situated in the county of ..... and State of ....., to wit:

That part of the ..... lode beginning on the ..... level at a point ..... feet ..... from the ..... shaft; thence along the back of said level ..... feet ..... and in height ..... feet, more or less, to the bottom of the next level above, being the ..... foot level, and only upon the ore streak or seam upon which said levels are run, and not otherwise unless hereinafter in writing stipulated, together with the use, as may be necessary in working said premises, of said ..... level and of .... shaft and ..... tunnel, in common with said company and its other lessees, contractors and other employes, in such manner as may be hereinafter stipulated.

And in consideration of said demise or lease the lessee doth covenant and agree with said company or lessor that he, the said lessee, will truly do and perform all things required by the following stipulations hereof, subject only to the reservations hereinafter contained:

1. To enter upon said premises and to work the same mine-fashion in manner necessary to good and economical mining, so as to take out and save the greatest amount of ore possible, with due regard to safety of the premises and preservation of adjacent parts of the mine, and in accordance with the special covenants hereinafter reserved.

2. To work and mine said premises steadily and continuously from the date hereof, and to completely and fully stope and work out all merchantable ore from the ground therein before the expiration of the term of this lease, so that no part of the ground shall be buried or covered over.

3. To remove such rock and earth as is necessary as fast as it is broken; to do no underhand stoping; to well and sufficiently timber said premises to the satisfaction of the superintendent of said company, at all points where required by good mining, and to repair all old timbering if necessary.

4. All shafts or winzes, if any required, shall be 3½ feet by 6 feet in the clear, inside of timbering, and all drifts 6½ feet by 4 feet, and substantially timbered and secured in good and workmanlike manner, and all stopes to be secured in like manner by timbering or stulling over the drifts; and the level above said premises shall be secured against sinking into the stope by substantial timbering in such manner as shall be approved by the superintendent of the company.

5. Whenever the company shall, by its employes, contractors or lessees, work any other portion of the mine in such manner as to require the use of the level over which said demised premises are situated, lessee shall keep such level clear, so as not to interfere with such use.

6. All dumps formed in the working of this lease shall be the property of the company; shall be made where directed by the superintendent, and shall not be picked or worked for ore by the lessee.

7. The lessee shall, at all times during the term of this lease, hold and keep safe possession of said leased premises for and as lessee of said company, and will at no time permit the same to be unoccupied, and will permit no person not in his employ, or not having permission from said company, to have access thereto.

8. All work under this lease shall be subject to

the general direction and superintendence of said company, its superintendent and foreman, who shall at all times have full access to all the leased premises.

9. No person or persons shall be employed by or remain in the employ of the lessee whose employment shall at any time be objected to by the superintendent of said company.

10. All ore taken out of said premises by the lessee is and shall be the property of said company, unless otherwise ordered by the superintendent of said company, and shall be delivered by the lessee at such convenient place on the surface as the superintendent shall direct, and shall be properly dressed and sacked by the lessee, and the cost of hauling said ore, and weighing, crushing and assaying the same, shall be paid to said company by said lessee, it being understood that the lessee has full privilege of joining with the agent of the company in seeing to the proper weighing, sampling and assaying of all ore produced under this lease.

11. Said company shall retain as royalty or rental for said premises 60 per cent of all the ore produced by the lessee therefrom, and shall pay to the lessee the value of the remainder of said ore, at the highest market price on the day when the ore is crushed and sampled, less reservations hereinafter stated; the ore retained as royalty and that purchased from lessee to be crushed and sampled together, and to be of the same assay value. The company may have the ore crushed and sampled at such mill as it may select, or may itself crush and sample the ore. The lessee may have control of assays made, and upon failure of agreement upon assay and price, reference shall be had to arbitration by one or three disinterested persons, whose adjudication shall not be lower than the lowest assay or price, nor higher than the highest assay or price claimed, and shall be final.

12. The lessee and employe shall not set up or make any claim whatsoever to any lode, vein or deposit of ore discovered in the working of this lease, but shall and do hereby concede and quit-claim all title in such discoveries to said company.

13. The lessee shall not acquire any rights from location or construction of any tunnel driven to intersect the demised premises; but all such rights, if any accrue, shall inure to the benfit of said company.

14. All blacksmithing required by the lessee shall be done by the company, unless the superintendent shall otherwise direct, and the price to be paid to the company by the lessee therefore shall not be greater than that charged any other lessee of the company for like work.

15. The said company, when convenient, will furnish to the lessee all mine timbers, lagging, powder, fuse and candles used in working under this lease, for all of which the lessee shall pay to the company the usual price delivered at the mine in like quantities.

16. The company shall do all tramming at the expense of the lessee, unless the superintendent shall otherwise direct.

17. The company may reserve from payments made to lessee for ore 2 per cent thereof until the expiration of this lease, as security that the entire amount of merchantable ore in said demised premises shall be fully stoped out as hereinbefore required, and as security that the covenants of this lease shall be fully performed; and the said lessee hereby especially agrees that if this lease shall be terminated by failure of performance of any of the covenants on his part herein made, or if all said merchantable ore shall not be stoped out before the end of the stated term of this lease, then the money so reserved may be retained in possession, and shall become the absolute property of said company as liquidated damages for failure of covenants by said lessee. Reservation may also be made from payments to the lessee of all indebtedness due by him to the company.

18. Neither this lease, nor any interest in it, shall be transferable, and any assignment thereof, whether verbal or written, attempted to be made, shall operate as a cancellation of this lease. If said lessee shall at any time cease to personally work, or superintend the work, in said premises, it shall be construed as an abandonment or attempted transfer of the lease, and the company may take immediate possession and annul the lease.

19. It is mutually understood and agreed that said company shall in no event be held liable for damages or any indebtedness that may be incurred by said lessee in working this lease.

20. If said lessee shall hide or secrete or ship any ore in a fraudulent manner, then this lease to become void and of no effect.

21. The foregoing conditions and stipulations shall not be considered as changed or modified in any way except as hereinafter written.

And it is further stipulated and agreed that the superintendent of the said company is hereby constituted sole judge of the fulfillment of the covenants herein entered into by the lessee, and any failure of fulfillment and performance by the lessee of any such covenants or stipulations shall operate as a forfeiture and annulment of this lease, and the term thereof shall come to an end, and the company shall be entitled to immediate and exclusive possession of the leased premises; and at the end of the term of this lease, or upon forfeiture thereof by violation of its covenants, the said lessee agrees to surrender to said company, its agents, superintendent, successor or assigns, the above demised premises, with the appurtenances and all improvements in good order and condition, with all shafts, tunnels, drifts and other passages thoroughly clear of rubbish, and drained, if necessary. Lessee further agrees and declares this to be his letter of attorney to the acting sheriff of the county, hereby fully authorizing and empowering him, at the request of the lessor, on the termination or forfeiture of this lease, or at any time thereafter, to enter into and take possession of all said leased premises, and the properties thereto belonging, and deliver the same to lessor without process of law, or upon termination of forfeiture as aforesaid, or at any time thereafter, the said company may, at its option, with or without force, with or without process of law, enter upon said premises and dispossess all persons occupying the same.

It is mutually understood and agreed that said company shall in no event be held liable, by virtue of any implied warranty of title or covenant in this lease contained, or otherwise, for quiet enjoyment of the said demised premises, or of the product thereof, in case the lessee should be evicted from the demised premises, or any part thereof, by any title paramount or otherwise, or in case any injunction be granted against either of the parties hereto, restraining them from working under this lease, or upon the demised premises or any part thereof.

In witness whereof the said company has, by its superintendent, hereunto set its hand and official seal, and the said lessee has hereunto set his hand and seal.

....., Lessor.

....., Lessee.

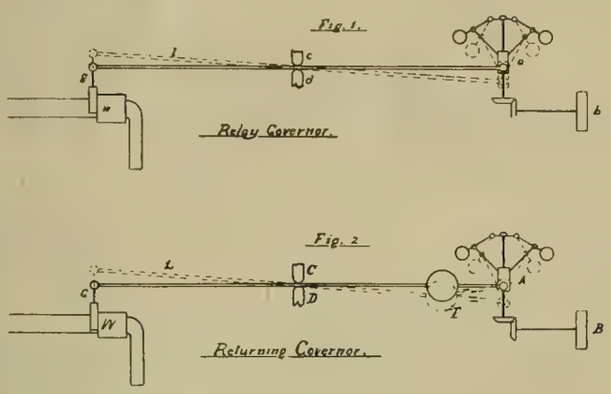

PLATE V.

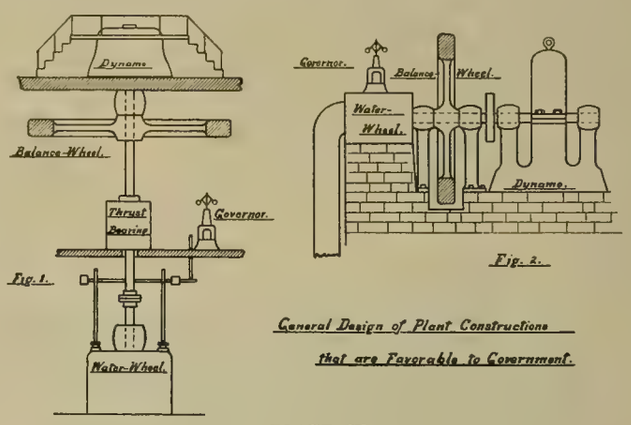

PLATE VI.

Speed Government in Water-Power Plants.*

NUMBER V—CONCLUDED.

MARK A. REPLOGLE.

Before closing it will be necessary to make a few suggestions concerning governors. A properly constructed governor must open the water wheel gates as fast as gravity can follow up with water, no faster. It must close the gates slow enough to insure safety to the penstocks, no faster. It must be capable of stopping the gates at any degree of opening. It must be endowed with the relay principle, adjusted to co-operate properly with the power storage. It must not be a separate and independent feature of the power plant, but must be made a part of the plant in an intelligent manner, and at best it is only one of the factors in the government of a water power plant. It must be remembered that all the governor can do is to open or close the gates as the variations in speed require, and no water wheel can be governed successfully by varying the gate openings unless the same principles are adhered to that make government in steam engines a success.

*Journal of the Franklin Institute.

The relay principle allows the governed motor to run at a slower speed when loaded than when running empty. This is for the purpose of using systematically the stored energy of the revolving parts of the power unit. Recently a new feature, generally known as the returning principle, has been added to some of the best-known governors. Both the relay and returning features will be shown in Plate V.

It is well understood that water wheel gates are too ponderous to be moved directly by the centrifugal effect of pendulums. It is necessary to allow the speed governor to trip some heavier mechanical apparatus which moves the heavy gates. In some governors the pendulums throw into action an auxiliary power that in turn trips the apparatus that moves the gates. In Fig. 1 a is a speedy governor, b its pulley that receives motive power from the water wheel shaft, c is a trip to cause the heavy apparatus to close the gate, d is a trip to cause the mechanism to open the gate, w is the wheel, g is the wheel gate, and l is a connection between gate and speed governor. (For the sake of convenience in the illustration l is a straight lever.) When the lever is so held by the governor balls that it touches neither c nor d, the gates do not move. If a change in load causes the speed to drop, the governor balls will allow l to touch d, and immediately cause the power mechanism to begin to open the gate. The gate in opening will raise l off of d, as is shown in dotted lines, causing the gate-moving apparatus to drop out of action. If this operation did not add new power enough to prevent the speed from a further drop, the same operation is repeated until the new power balances the demand and l touches neither c nor d. It will be noticed that the governor balls are running at a lower position after the gate has been moved to a wider opening. In practice this is a fact, and in this lowering of the speed a portion of the stored energy of the plant is fed out and used in carrying the new load, until the effects from the increased gate opening can be had. If the power storage of the plant is proportioned properly to the change made in load, the speed can never fall out of the relay limits of the governor. But if the power storage is deficient, the speed on making a heavy change in load will quickly drop out of the relay limits, and the governor will then be at sea. The effect is called hunting or racing by engineers. (Let it be understood that an increase in speed will cause l to touch c, and close the gates in a similar manner.)

Fig. 2 is similar to Fig. 1, with the exception that L is flexible or jointed at E. In a change of load L operates as a stiff lever, but after the equilibrium has been temporarily restored the lever L slowly begins to bend at E, allowing A to return to its original position. This bending or returning will cause L to touch D and add a little more water, until A has found its original position or speed, as is shown by dotted lines. It will be noticed that the power storage in Fig. 2 is made use of in adding new load, by lowering the speed in the same manner as in Fig. 1. But this defect is corrected later by the returning principle. The effect of the returning principle is to return the speed always to normal, leaving it identical with the speed at no load, a condition not ordinarily found in speed government where the relay governor is used.

Let it be understood that all steam engines that are successfully governed are controlled by the use of a relay governor, although it is not apparent to the casual observer. Some of our best steam engines use the returning principle in connection with their governing, although no reference is made to it in ordinary conversation concerning steam engine government.

The science of water power government has not yet reached so great a degree of perfection as the government of steam power, yet the underlying principles are being carefully studied by our engineers, and the time is not far distant when our water powers will all be constructed and governed as reliably and successfully as our steam plants are, but that time will not come until the same principles are recognized in the former as in the latter. (Plate VI).

Some Metallurgical Methods.*

NUMBER IV.

From the cooling floors the chloridized ore is hauled to the lixiviating works and there dropped into leaching vats, of which there are twelve, arranged in two rows, with footways between them and tramways over them. Each vat is circular, made of 3-inch thick timbers, the bottom timbers being tongued and grooved and the sides simply butt joints, the whole stayed with wrought iron straps passing around the vats. The diameter is 16 feet and the depth 7 feet, and with a 5-inch false or filter bottom, made of rough cobble stones about 4-inch ring size, and covered with a layer of straw. The vats are filled up to within about 12 to 15 inches of the top, and hold about forty-nine to fifty tons of the roasted ore.

The vat of ore is first washed with hot water, at the rate of 16 inches an hour, for one and one-half to two hours. This dissolves out a very considerable quantity of the lead chloride and salt in the ore. The wash water runs into depositing pits outside the building, where the metallic contents are precipitated by scrap iron, the after liquor running to waste. After washing, a 1 per cent solution of sodium of hyposulphite is run on the ore, and of a temperature as nearly as possible about 100° Fahr. The speed of the leaching is from 4 to 6 inches per hour, and usually takes forty to fifty hours to finish a vat. Ten hours after the leaching liquor is put on, 360 pounds of carbonate of soda are put on top of the ore under the stream of hyposulphite of soda, which dissolves it up. This is added for the reason that the lead chloride not extracted by the first wash water attacks the solution of hyposulphite of sodium, decomposing a portion of it and forming lead hyposulphite. If carbonate of soda is added to the hypo-solution, it in its turn decomposes the lead hyposulphite and forms carbonate of lead, and regenerates the hyposulphite of soda before destroyed. Lead carbonate, being insoluble in hypo-solution, is not again attacked. It was found that about ten hours after the hyposulphite solution was run on the ore was the best time to put in the carbonate of soda. Some experimenting took place to determine the proper hour, and it was found that the best silver extraction results were obtained if this rule was maintained.

The solution of hyposulphite of soda, with silver and lead in it, is conducted into one of a series of circular precipitating vats, each 10 feet in diameter and 9 feet deep. When the vat is full the lead in solution is precipitated by a saturated solution of carbonate of soda, using phenol for the akaline reaction, which is taken as a sign that the lead is all precipitated. Some silver goes down with the lead, so that the precipitated carbonate of lead usually assayed about seventy ounces of silver per ton. The liquor with the precipitate in suspension was blown with compressed air for twenty minutes or thereabouts, the precipitate settling very rapidly afterwards. When the supernatant liquor was quite clear it was drawn off into one of a series of six vats, of the same size as the lead-precipitating vats. Here the silver was precipitated out by sulphide of sodium, and, on settling, the clear liquor was run through a sand filter and elevated back to the hyposulphite tanks in the top of the building, ready for use again on fresh vats of ore. The sludge of carbonate of lead was run into two storage vats, each 10 by 7 feet, and from these was sucked into a boiler-iron pressure tank, with a vacuum created by a steam ejector. When the tank was full the suction tube was closed, the steam ejector stopped, and a tap opened which admitted compressed air, so forcing the semi-liquid sludge into a Johnson filter press, at a pressure of sixty pounds to the square inch. The liquor from this press was returned to the silver precipitating vats, and there treated. The dry cakes of carbonate of lead obtained from the filter press were sent to the blast furnaces for further treatment.

The silver sulphide was filter pressed in similar manner from storage tanks 7 feet 9 inches diameter by 5 feet 9 inches deep, and the dry cakes roasted and melted with poor lead to make a rich bullion. The roasted ore handled was equal to about 1000 to 1100 tons weekly, and the average apparent extraction of silver was about 79 per cent. The real extraction, after taking into consideration the 6½ per cent solubility of the ore, was 80¾ per cent. The roasted ore treated usually averaged between twelve to fourteen ounces per ton of raw ore. The total cost of leaching, counted on the raw ore originally crushed at the chloridizing plant, amounted to about 6s 9d per ton for all costs, including chemicals, labor, superintendence, water, light, stores, repairs, renewals, coal, scrap iron, etc. The water consumed cost about 4s per 1000 gallons, and, roughly, 100 gallons were used for each tons of ore roasted. The cost of chemicals made up 2s 6½ per ton of the total cost. The sodium sulphide was prepared in the works, being made of two parts caustic soda and one of sulphur, boiled with steam to assist chemical union.

The following represents appoximately where the silver was recovered in the different operations performed in the leaching department: In the sulphide precipitate, 75.78 per cent of the whole; in the carbonate of lead, 6.31 per cent of the whole; in the wash water, 16.44 per cent of the whole; in the vat bottoms, 1.47 per cent of the whole; total, 100.

The total men employed in the leaching works were as follows for each day of twenty-four hours: Three chemical mixers, three ore vat men, nine men at filter presses, three precipitating men, three shift bosses, twenty men removing leached ore; total, forty-one men. Salt costs 36s 8d a ton, coal 34s, and wood 14s a ton. The plant cost on completion a little over £15,000.

The Russell extra solution was used some years ago, but no apparent benefit was obtained by its use, and it has been discontinued since about 1893. Taking the hyposulphite process as a whole, it has not been very successful, due to the character of the ore and the particular form the silver found combined in. Usually the latter consists of native silver, iodides, and chlorobromides. I do not think pure silver chloride exists in Broken Hill ores. Until the chloridizing furnaces were built the process had given rather disappointing results. Better results were obtained when chloridizing furnaces began to work; but, then, the percentage of lead began to rise in the available ores. The carbonate of soda addition to the vats seems to have conquered all difficulties until fresh ores turn up. Of all the by-products made from the leaching plant, that from the wash water precipitate has been the most troublesome. As the hot wash water cools it deposits chloride of lead that is not wholly decomposed by the iron scraps, and when the precipitate from the tanks is cleaned up and sent to the smelting plant heavy losses in volatilized chloride of lead were experienced. The most satisfactory solution of the difficulty is adding oxide of lime to the solution and precipitating the lead and silver in that way as oxide. The by-product of chloride of calcium can be let go to waste. It is a matter of expense only, as the reactions are perfectly satisfactory.

(*To be Continued.*)

Forest Endowment of California.

J. G. Lemmon the California botanist gives some facts about resources in genera and species of trees.

More Kinds of Tress Than any Other Equal Area of the World.—The narrow strip of territory stretching along the western coast of North America, 800 miles long by 150 miles wide, known as California, is peculiar in many ways, and in none of them more marked than in its forest wealth. This forest possesses the most kinds of species of trees of any equal area in the world; and these trees are either the largest in dimensions or they bear the circumstances that give to the phenomenon the appearance of a distinct endowment. Omitting the broad-leaved trees, there are forty-three species of evergreen or resinous-wooded, cone-bearing trees in this State. Of these twenty are pines, six are spruces, five are true firs, two are redwood, two are American cedars, five are cypresses, three are junipers and two yews.

Our Pines.—Of these trees two of the pines are the largest trees of the family, often attaining a height of 300 feet with a diameter of 15 to 20 feet. No pine of any other land attains half of these dimensions. Four of our pines bear longer or heavier cones than are found abroad, the cones of the sugar pine being often 20 to 24 inches long and that of the Coulter pine often weighing 10 pounds. The longest cones outside of the State scarcely exceed 6 inches and the heaviest weigh but one pound.

Spruces and Firs.—Two of our spruces attain enormous dimensions. The Douglas spruce of the Sierra becomes 400 feet high with a trunk 12 to 15 feet in diameter. The great tide-land spruce of the coast is but little less in dimensions. Two of our firs become twice as large as any fir in foreign countries, 300 feet high and 12 to 18 feet in diameter, and their cones are 6 to 8 inches long, while those of the old world are but 2 to 4 inches.

Other Trees.—Our world-renowned redwoods, rising to a height of over 400 feet and enlarging while yet young to a diameter of 30 to 40 feet, with a life of 3000 to 5000 years, are not approached by any vegetable growths elsewhere.

There is scarcely a genus of trees found in the northern hemisphere that is not represented here, and the few that are limited to other regions are mostly small trees or they produce diminutive cones.

This prodigality in numbers and sizes extends to other growths. Our oaks are numerous and immense, with monstrous acorns and acorn cups. Our maples bear leaves 6 to 8 inches across.

Trees of Other Regions. — The northern part of the eastern continent, or Eurasia, is approximately 9000 miles across; North America 3000 miles. One would naturally look for three times as many pines in Eurasia as in America, but just the contrary is the case. Of the eighty species of pine, twenty are indigenous to Eurasia while sixty are in North America. The Pacific slope is 1000 miles wide, one-third of America, but it has forty pines. Of these fifteen are all in Mexico, twenty-five in northwest America and the whole number of species of pines in the world is eighty.

The Influence of the Japanese Current Upon Pacific Coast Weather.

It seems that the popular idea about the influence of the Kuro Siro or Japanese current upon our coast weather needs reviewing in connection with other wider-reaching phenomena. The U. S. Weather Bureau, makes some editorial comments upon the subject.

Popular Impressions Incorrect.—It would require a learned antiquarian to collect all the popular meteorological errors that have been started from time to time and that are still afloat in some part of the world, like derelicts on the ocean. It is not so very long since Professor Loomis demonstrated the error of those who maintained that there is a specific equinoctial gale or storm that reappears every year. We are even now just emerging from the influence of a century of delusion relative to the idea that forests produce rain and that agricultural cultivation of the soil produces drouths. We have just, within twenty-five or thirty years, obtained a clear conception of the warm, dry, descending winds when, lo! a new error with regard to them appears. A century ago it was rational to inquire whether the Gulf Stream had any influence on our own or European weather, but now we know that if it has any, it is at least inappreciable in comparison with the general influence of the ocean. Similarly in the case of the Japanese current, or Kuro Siro, which is to the Pacific what the Gulf Stream is to the Atlantic, we have now from Montana a new query as to its action in forming chinook winds. A first glance at the map of the world must arouse in the mind of a rational person grave doubts as to whether the chinooks of Montana come from the Japan stream. This latter is fully 6000 miles distant. The winds that blow over it form a part of the general circulation of the Pacific ocean; eventually, they get into a whirl around the great depression in the North Pacific ocean in the neighborhood of the Aleutian islands. The rain and fog in this region and on the coast of Alaska, British Columbia, Washington and Oregon are demonstrably due to the evaporation from the Pacific ocean as a whole and to the fact that the winds are rising up over the Rocky Mountain region.

Japan Current an Effect Not a Cause.—The Japan current, properly so-called, is due to this circulation of the winds; the winds are not due to it. Each square mile of the Pacific ocean has a slight influence on this circulation, but the Japan current does not occupy 1 per cent of this area. The mere fact that the westerly winds are rainy and cloudy on the Pacific coast but are warm and dry in Montana suffices to show that they have undergone a change in passing over the mountains and that the main features of these winds are due to something that takes place in the Rocky Mountain region and not on the coast of Japan.

The map of the winds over the North Pacific in the winter months shows a powerful and prevailing cold, northerly current flowing from the interior of Asia over Japan south and southeastward, most of which then turns to the southwest over the Philippine islands into the Indian ocean. What little passes over northern Japan and eastward to the middle of the Pacific ocean then turns northward and returns in its circulation around the Aleutian area of low pressure. Not one part in 10,000 ever reaches Montana.

Our Southwesters.—On the other hand, the southwest wind of our Pacific coast can easily be traced a little farther southwest and then southerly to the Hawaiian islands, being a part of the circulation around an area of high pressure whose center lies a little southwest of San Francisco and northeast of Hawaii. These two systems of winds circulating about the highs and lows on the Pacific represent only what is going on at the very bottom of the atmosphere. If we go up 15,000 or 20,000 feet into the region of the upper cirrus clouds that float over all this part of the globe, we shall find them all moving from the west, or between northwest and southwest. It seems likely that a slow process of interchange takes place between this highest stratum and the lowest stratum. In this process the air within the areas of high pressure has a general descending tendency, that is to say, it is drawn from the upper level or that of the cirrus clouds, while the air within the areas of low pressure has an ascending tendency, and eventually reaches the level of the cirrus clouds. But these general tendencies upward and downward require considerable time; it may be days or weeks or months, according to circumstances, to complete an entire circulation for any given particle of air. In the course of this long period any given cubic foot of air may be dispersed in all directions, some of its particles going northward and some southward, some ascending and some descending, until it is so dispersed that it would be impossible to trace the air that forms a chinook in Montana backward to any given region 500 miles away.

Rain in the Hawaiian Islands.—Our correspondent, Mr. Curtis J. Lyons, in his report for March states that "the month has been an unusually rainy one throughout the group. Kaumana, near Hilo, Hawaii, reports 55.58 inches; 10.18 inches fell at Luakaba, Oahu, five miles from Honolulu. On the

24th unprecedented floods did much damage, especially in Oahu and Kauai; heaviest rain on north side of Oahu on the 27th. Frequent thunder and lightning from the 12th to the 24th."

A study of the general circulation of the atmosphere leads to belief that the conditions that bring drouths or floods to the Indian ocean, Asiatic coasts and Australian regions move slowly eastward over the Pacific and are eventually felt in North America. We shall, with interest, look for a rainy season at some time following these floods in the Hawaiian islands.

Departure of the Monterey.

The cruiser Monterey, illustrated on this page, left San Francisco this week for the Philippines. The month of May, '98, was a momentous one for U. S. history. Public opinion declared against the hundred-year old policy of the U. S. Government, and imperiously required Hawaiian annexation and possession of the Philippines. In this San Francisco has had prominent part. It was from the bridge of a San Francisco built vessel—the Olympia, built by the Union Iron Works—that Admiral Dewey directed the great fight at Manila. It is a San Francisco built battleship—the Oregon—that is now attracting the attention of the world's naval authorities by her 14,000-mile round-the-Horn voyage, arriving in fighting trim and needing no repairs. Other San Francisco built ships have given good account of themselves in every sea and are foremost now in connection with this acquiring of island empire in Eastern waters.

The Monterey, which went through the Golden Gate en route to the Philippines last Tuesday, is a double-turreted, twin-screw, armored coast defense vessel, launched by the President of the United States—Benj. Harrison, in May, '91—from the yard of the Union Iron Works, the third man-of-war launched up to that date from the ways of that firm. She is steel built throughout, double bottom; there are 110 water-tight compartments in her hull that can be promptly filled with water, submerging her sides until she has but one foot free board.

The propelling engines are of the triple-expansion type, 30 inches stroke, the high-pressure cylinder being 27 inches, the intermediate 41 inches, and the low-pressure 64 inches in diameter, which, with the vacuum, etc., develop, with steam pressure at 160 pounds per square inch and 150 revolutions per minute, 5000 H. P. There are two steel main boilers, 11 feet 2 inches in diameter, length 10 feet 7 inches, with four other tubular boilers in addition, all designed for a pressure of 160 pounds.

The armament of the vessel is: Two 12-inch breech-loading rifled guns with 13-inch steel armor protection; shield 8 inches thick; projectile weighing 850 pounds; powder charge 425 pounds; two 10-inch breech-loading rifles mounted en barbette, with 11½-inch steel armor protection; steel shields 7½ inches in thickness, projectile weighing 500 pounds and powder charge 250 pounds.

There are also fifty-four 6-pound rapid-firing rifles; four 37-millimeter Hotchkiss revolving cannon and two 1-pound rapid-firing rifles. In addition to the above armament, she has a 15-inch pneumatic dynamite gun, which will throw 1000-pound projectiles containing 500 pounds of dynamite or other high explosives.

The Monterey was the first ship of the United States Navy fitted with the Ward sectional boilers. The engines, boilers, magazines and all the machinery is protected by armor, 16 inches in thickness.

Originally built, like the Oregon and Olympia, for San Francisco harbor defence, she, with the two named, now goes to fight foreign foes in their own waters, and, as in the case of the others, will doubtless aid in upholding the nation's flag in any stress.

In connection with the departure of the Monterey, probably never to return, it is interesting to note that in the present war with Spain, the war vessels built by the Union Iron Works of San Francisco, and largely manned by Pacific Coast seamen, fill the public eye almost exclusively. At the great San Francisco shipbuilding establishment have been built the first-class battleship Oregon, the coast defense doubled turreted monitor Monterey, the U. S. cruisers Charleston, San Francisco and Olympia. There have also been built the U. S. gunboats Marietta and Wheeling. At present the Union Iron Works is building the U. S. torpedo destroyer Farragut and the U. S. battleship Wisconsin. The recent great trip of the Oregon justifies the statement that San Francisco has an institution that has built the most perfect warship ever produced.

Something New in Dam Building.

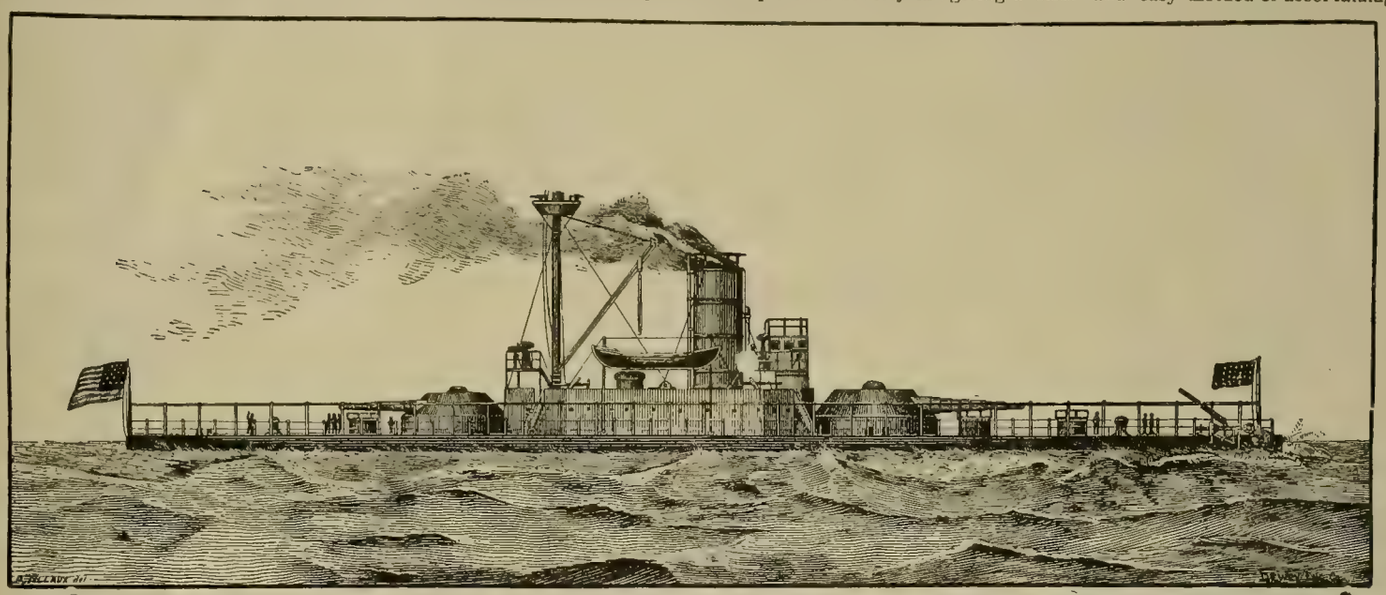
The dams built in California by the hydraulic miners to comply with the requirements of the Debris Commission are small affairs in comparison with some of the storage reservoirs and restraining dams in some portions of the State for irrigation, electrical, and general supply: masonry dams of massive construction being not uncommon. But at Ash Fork, Arizona, has recently been completed a novelty in such building, being a steel dam in which all pressures and strains are resisted directly by the steel framework. In the dry territory traversed by the Santa Fe railway great expense has been incurred in getting water for the locomotives and stations. Two years ago the company decided to establish large reservoirs by damming some of the valleys and canyons. Three such reservoirs have been established in Arizona, two of which are formed by masonry dams, and the third by a steel dam, near the town of Ash Fork, situated four miles east of the station of that name on the Santa Fe Pacific railway (Atchison, Topeka & Santa Fe railway system), and the northern terminus of the Santa Fe, Prescott & Phœnix railway. Previous to the establishment of this reservoir, water was brought by rail from Williams, twenty-three miles away, and at times from Bellemont, forty-five miles distant. The reservoir was established mainly for the purpose of supplying the engines of the Santa Fe Pacific railway, and incidentally for supplying the town of Ash Fork and the engines of the Santa Fe, Prescott & Phœnix railway. The average consumption is estimated at 90,000 gallons per day. The reservoir has a capacity of 37,000,000 gallons, taking the flow from a drainage area of about twenty-six square miles, and it is believed that the evaporation will amount to about 9 feet per year. The steel dam is 184 feet long on top and about 300 feet in total length, if a short concrete abutment at either end is included. Its greatest height is 46 feet. Structurally it consists of a series of triangular steel-bents or frames, resting on concrete foundations and carrying steel face plates on the inclined or upstream face of the bents.

The foundations for the steel bents are of concrete, composed of one part of Alpha Portland cement to three parts of sand and five parts of broken stone. The stone used was the excavated rock, broken up by hand hammers. The foundations for the vertical and the inclined posts were built before the iron work was erected. The vertical posts rest on concrete walls, and the higher walls are faced with rubble masonry on the side facing the canyon. The outlet is a 6-inch pipe embedded in concrete in a trench excavated in the rock under the dam, the pipe terminating in a drain within the reservoir.

From the downstream end of this pipe a 4-inch pipe line extends to Ash Fork, four miles distant. A notable feature of this structure is that there is no spillway or waste weir, the dam being designed to safely permit a flow of 6 feet deep over its crest, which is believed to be greater than will ever be experienced. It may be that the flow over the crest will occur so seldom that the rock under the overfall can take the wear without danger, and a protective may be unnecessary.

State Mining Bureau Work.

TO THE EDITOR:—I notice in the current number of the MINING AND SCIENTIFIC PRESS an article signed "Miner," criticising the deviation by the present State Mineralogist from the usual custom of publishing a biennial report on the mines of the State, as called for by the law, and devoting instead a part of the appropriation for "field work" to mapping the mineral counties of the State.



There has always been a demand for maps of the mineral counties of the State, and a general complaint that the reports of the Bureau did not supply them, the few that were on hand having long since been exhausted.

In view of the general demand for such maps it was decided to devote a portion—the 60 per cent of the appropriation for field work—to a series of maps giving a clear and easy method of ascertaining the location of every principal mine in each county. Accompanying the map will be a table giving the location of the mine, character of its ores, depth of shafts, length of tunnels, composition of its walls, power used—steam, water or electric—hydraulic or placer, name and address of owner and superintendent, number of men employed, all of which mines will have a reference number on the map, showing its precise location, distance from prominent points. This condensed information will have the merit of being portable and in condensed form, giving, as it will, about all the information usually required.

"Miner" complains that the fund for field work is being diverted from its legitimate object and purpose, and that map making is "office work," in which I beg to differ with him. The office work is merely working out the details of field work. As the last Legislature made no provision for the support of the State printing department, no mining report or other State printing can be done until the next Legislature makes an appropriation for the purpose, which would not be available for two years. Hence all field work made at the present time would be obsolete and a waste of money.

It is true the law calls for the publishing of a report from the bureau biennially, but if the State printing department has "shut shop" and gone out of business, "how can?" Meantime the work of making maps must necessarily require time, and probably until the State is ready to resume business.

San Francisco, June 7th, '98. O. L. R.

ARMORED COAST DEFENSE VESSEL MONTEREY.

A NEW use for graphite has been found in connection with brazing. It is found that by mixing a certain quantity of graphite with water or turpentine, in a thin paste, and applying this to those parts of a steel tube to which it is desired that the melted brass shall not adhere, the graphite prevents this adhesion, and does away with filling. The graphite has a strong affinity for metal surfaces and is not affected by heat, and therefore it easily keeps its place on the tubes during heating and prevents the adhesion of the brass.

Prospecting With Hand Auger and Drill.

William A. Carlyle gives some pointers that may be of value to prospectors in the following:

Having had occasion during the past year to do a large amount of prospecting work, I have found the use of a hand auger and drill of immense value in this respect, and in my practice it has largely superseded and always preceded the other forms of investigation. I believe that the information desired was thus acquired at one-fifth what it would have cost by any other method, and I am satisfied that a brief account of the work of this device will not be without interest.

Mr. Dorton, of the United States Geological Survey, has referred to the excellent results obtained in his work by the use of a small auger, and a similar instrument has no doubt been used for prospecting purposes; yet it seems to no one's interest to manufacture them—at least, I could learn of none on the market. I was therefore compelled to make them, with such additions and modifications as experience showed to be necessary. The result may be summed up in the following description of a set of tools:

1. An auger bit of steel or Swede iron, with a steel point, twisted into a spiral, with an ultimate diameter of 2 inches and ultimate thickness of blade of not less than ¼-inch. The point is found more effective when split. The length of the auger was gradually increased until about 13 inches was reached, as the apparent maximum which could be used effectively.

2. One foot of 1⅝-inch octagonal steel, with a 2-inch cutting face, which is likewise welded on to 18 inches of pipe, cut for connection.

3. Ten feet of 1¼-inch iron rod, threaded at either end for connection with 1-inch pipe. When connected with one of the drill bits this becomes a jumper for starting the holes through hard material.

4. Sections of 1-inch pipe and connections.

5. An iron handle, with a total length of 2 feet, arranged with a central eye for sliding up and down the pipe and with a set screw for fastening it at any point.

6. A sand pump, consisting of 1 or 2 feet of 1-inch pipe, with a simple leather valve and a cord for raising and lowering it.

7. Two pairs of pipe tongs or two monkey wrenches, with attachments for turning them into pipe tongs.

8. Sundries: 25 feet of tape, oil can, flat file, cheap spring balance, water bucket, etc.

The auger is used by two men, who, standing on opposite sides, turn it by means of the handle. Enough water is continually used to soften the material. At every slight change of material the depth and character are recorded.

When hard material is encountered the auger bit is screwed off and the drill bit screwed on, thus forming a churn drill, which may be used for passing through the hard material, the auger being replaced when softer material is reached. When the drill is used the muck is either worked stiff enough to admit of its being removed with the auger, or it is extracted by means of the sand pump or a hickory swab.

In passing through "wash ore" the material is brought up by the auger, put into a vessel with a finely perforated bottom (an empty tomato can, having holes punched in the bottom and provided with a wire handle, does very well), weighed by means of the spring balance, washed and weighed again, and thus an approximate idea is obtained of the proportion of ore in the material, while a sample is secured for analysis.

As the mere recollection of the contents of the several holes cannot be safely depended upon, it is very important that an accurate record be kept. To secure this is one of the difficulties encountered with ordinary foreman, though they are generally found to recognize very slight changes of material. My foremen were provided with small pocket notebooks, and were soon trained to write down everything and to trust nothing to memory.

The holes were located as far as possible with reference to some natural object, or to some other hole so located, and the distance was in all cases measured, not guessed at, the compass direction being recorded. Every hole was marked with a substantial peg bearing its number and location.

In designating the holes upon the record, care was taken to avoid all causes of confusion. Separate properties or great natural divisions on large properties were designated by letters, minor divisions by numbers. For instance, we would have for the first number a certain location on a property "Location H, Drill Hole 8000." The first number in the next natural division to the southward of the same property was designated "Location I, Drill Hole 9,000," and so on. By allowing 100 holes for the minor divisions of each locality, it was made possible to return and put in additional holes without confusion or conflict. With such a record, it was possible to plat the location of the holes in plan or elevation and give a visible representation of the "lay" of the strata intersected.

Of course, the best work with such work is done on soft material, but it is entirely practicable to go through hard material (quartzite or flint and ore being often encountered in a single hole), and the ability of this simple contrivance to go through interbedded layers of hard and soft substances makes it very effective.

The cost per foot increases considerably with depths exceeding 50 feet, but at the greatest depth I attained (some 80 feet) I did not reach either its capacity or the limit of its economical use as compared with other methods.

Up to 25 feet two men can operate it; from 25 to 35 feet, three men are necessary; from that to 50 feet, a rough frame, 15 to 20 feet high (costing something over $1) for the third man to stand on, is required. The frame can be moved from point to point. Above 50 feet, it is generally necessary to take off one or two of the top joints each time the auger or drill is lifted.

Dr. Emmens' Argentaurum.

It is much to be regretted that Sir William Crookes has thought it advisable to discontinue his experiments, in regard to Dr. Emmens' production of what he has termed argentaurum, but which he sells as gold, and claims to have produced from silver containing only a trace of gold. It will be remembered that the directions or particulars for conducting the experiment given by Dr. Emmens in his pamphlet "Arcana Naturæ" were distinctly stated to relate to other means of obtaining the transformation or transmutation than those actually used by Dr. Emmens himself. They were distinctly given as relating to a commercially unprofitable method, but, on the other hand, it was also laid down that, if the directions and instructions were followed out correctly, silver containing a small trace of gold would at the conclusion of the experiment be found to contain a greater amount. This Sir William Crookes has in some measure confirmed, for he found that one experiment with silver containing a trace of gold resulted in an increase of nearly 21 per cent in the proportion of gold present. Sir W. Crookes appears to regard this gain as within the limits of possible error in the experiment; but seemingly Dr. Emmens takes a different view, and is disposed to regard it as a proof of his contention that gold can be produced from silver. A subsequent experiment of Sir William's with pure silver from Mexican dollars resulted in failure to produce any gold; but Dr. Emmens always employs Mexican dollars having a trace of gold; this experiment is inconclusive, therefore, because, for one thing, as chemists are aware, the presence of an element has often an important effect on an experiment. If Dr. Emmens' contentions are correct, his discovery ranks in importance quite equal to any other scientific discovery of the age; for his discovery not only possesses interest from the monetary or profitable point of view of the possibility of transmuting silver into gold, but it possesses far wider significance in the possible entire change of present knowledge in all that pertains to metallurgy and other fields.—Industries and Iron.

Acclimatization in the Tropics.

The question of the white man's ability to conquer the tropics and to make for himself a permanent home in those regions is one that has mostly possessed a secondary interest for physicians in this country, but the war and projects of annexation make it probable that this will soon be changed. Porto Rico, the Sandwich Islands, and the Philippines are all tropical islands, and if they, one or all, come under our flag, doubtless many of our citizens will go thither to seek their fortunes, and the question of acclimatization becomes a practical one.

A timely discussion on this topic recently took place in London before the Royal Geographical Society, in the presence of many of the best-known authorities on tropical pathology. Most of those taking part in the debate held that there is no reason whatever why the white man should not be able to adapt himself to the new conditions of life in the tropics and protect himself against the diseases that prevail in those regions. The popular belief that the white man cannot successfully colonize the tropics is disproved by the fact that he has done so. It is undoubtedly true that many northerners who go to equatorial regions contract disease there and die, but in the majority of such cases the man is the victim tim of his obstinate unwillingness to change his habits in respect to eating, drinking and clothing, and to conform his new mode of life to new conditions.

The chief diseases, both acute and chronic, of tropical countries—those which formerly caused such ravages among the white settlers and gave rise to the prevalent theory that whites could only live in the temperate zone—are all microbic in origin and consequently preventable in great measure. We cannot, of course, expect to see them absolutely wiped out of existence, but their sting, like that of smallpox, can be extracted by means of an improved public and private hygiene. A comparison of the healthfulness of the West India islands under enlightened British rule with that of the two until recently under Spanish misrule shows what can be done by sanitation to convert a pest hole into a paradise.

Sanitation has within the last few decades wrought wonderful changes in all tropical countries, as regards health conditions, and the changes have been so great in some places that regions which were once considered most deadly are now even recommended as health resorts.

Heat and moisture are not in themselves the direct cause of any important tropical disease. The directcauses of 99 per cent of these diseases are germs. When these germs and their habits are known fully, victory will be within man's grasp. Most micro-parasites, when they are once within the body, are fairly safe. But these same parasites, in order that their respective species may keep in existence by spreading from one host to another, must at some time or another leave the human body, and during this necessary extra-corporeal state they are eminently vulnerable. To kill them then is simply a matter of knowledge and the application of this knowledge, that is to say, sanitary science and sanitation.

One earnest contention of those who argue against the possibility of successful colonization of the tropics by the white races is that, even if the original colonist lives out his natural term of years, his children will bear in themselves evidences of the degenerative influences of a hot climate. It is true that in many parts of the tropics the climate does cause a deterioration of white races. As an example of this is cited the offspring of British parents in India, who, if brought up in that country, do not reach the standard of stamina seen in the home-bred Briton. This is no doubt true of other places than India, and also of other than tropical regions, but it is not true of all tropical countries. It is a question whether it is the heat alone that works this change, or whether there are certain as yet unappreciated telluric influences which are responsible for the loss in stamina. In India, Ceylon, tropical America, and Australia, the problem of colonization may be regarded as solved. In other regions certain definite diseases still stand in the way, namely, malaria, dysentery and yellow fever in the West Indies, and black-water fever in Central Africa. The real question of colonization of the tropics lies in the finding of means of protection against the diseases named. That this means will some day, if not very speedily, be found can hardly be doubted.

Largest Pure Gold Nugget.

The largest nugget of pure gold ever found in America was picked up in California. This claim is made boldly and in the face of an article carelessly copied into the San Francisco *Chronicle* from a Philadelphia paper. The Quaker City publication cites a nugget taken from a mine near Helena, Montana, by the Conrad brothers, valued at $985, and says: "No larger has ever been taken from a mine in America, according to the best records on the subject. It was said that one was taken out of Nelson gulch once that was valued at $2300, but if it ever existed it found its way into the melting pot so rapidly that no one to-day is able to swear positively that he ever saw it. Another story tells of a $1700 nugget, but this one, too, is not to be found. The big nugget in the Conrad collection came from the Snowshoe diggings, having originally been bought from a miner named Price."

Now it so happens that Dr. Benjamin Shurtleff has in his possession the photograph of a nugget of gold found at Spring Creek, Shasta county, six miles from the old town of Shasta, June 25, 1870. It weighed 184½ ounces and had a value of $3300. Dr. and Mrs. Shurtleff, then residents of Shasta, handled the nugget and remember that it was almost entirely free from quartz or foreign substance. Their son George had it photographed and took the picture to San Francisco for exhibition. A watch and chain was photographed with the nugget by way of setting forth more clearly its size.

It is barely possible, now that a discussion of gold nuggets is to the fore, that other counties of California will come forward with specimens heretofore unmatched by Montana or any other mining region on earth, but the nugget from Shasta will doubtless continue to hold first place for size, weight and purity of quality.—Napa Register.

A WRITER in *Knowledge* makes a vivid picture of the great belt of clouds, some 300 miles in breadth, which surrounds the earth a little north of the equator. Within this belt rain almost incessantly falls, sometimes in sheets, and the wind seldom stirs. Before the invention of steamships, vessels becalmed in the "cloud belt" sometimes drifted helpless for weeks. Even now the crossing of this belt, where everything is surcharged with moisture, is a disagreeable experience for voyagers going from the North to the South Atlantic ocean, or vice versa. The belt can be traced across equatorial Africa and across the American isthmus, and the great rivers Amazon, Orinoco, Niger, Nile and Congo arise in these rain-soaked regions, which are like exhaustless reservoirs. The cause of the equatorial cloud belt is connected with the tradewinds, and in the course of a year it oscillates north and south over a distance equal to about three times its own breadth.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: At the Amador Queen No. 2, Jackson, the shaft is down 450 feet and 100 feet below the level of the tunnel where the hoisting machinery is situated. Sinking is progressing and some drifting is being done. ——The Union Consolidated mine has been closed down for the present, but operations may be resumed at short notice ——At the Amelia mine the shaft is down about 610 feet, and sinking is progressing. A crosscut has been run at the 600 level. It is intended to sink 1000 feet before drifting to strike the ledge.

Ledger: At Jackson drifting at the 500 level in the Amador Queen No. 1 has begun. The station at the 1000-foot level is nearing completion. ——The Wildman M. Co. will sink deep and increase its milling capacity to 200 stamps. To operate this plant will require about 1000 H. P.

Republican: A compromise will be made between the litigants of the Moore property. The mine is to be reopened.——Twenty stamps are dropping at the South Eureka mine. The contractor who has been sinking 270 feet from the 1250-foot level has finished his work —— Extensive repairs are making at the Kennedy mill. Ten stamps of the forty are running at a time.

Ledger: At the Lincoln mine, Sutter Creek, the old shaft has been retimbered 70 feet from the surface. Boilers are in position and ready to work.—— The Reward mine at Pine Grove has closed down temporarily. —— At the South Spring Hill mine, Amador City, development work is being pushed.——At the Central Eureka at Sutter Creek the shaft has reached a depth of 1140 feet. The ore vein shows up well in the bottom. —— At the Baliol the new shaft is down over 100 feet.

Butte.

The 2-stamp mill on the Buzzard mine at Inskip is running steadily.—— F. Brown, working on Secret creek, has been taking out nuggets lately ranging from $1 up to $13.—— H. G. Leavitt is taking out good ore and has enough developed to warrant the erection of a mill.

Calaveras.

The Esperanza Co. have their mill in shape at San Andreas for work when water can be had.—— The North Star is working a force and getting ready for fall. —— The Green Mountain hydraulic is running, but will be obliged to suspend for want of water.—— The 8-stamp mill on the Moser gravel mine commenced crushing last week.——Work is progressing at the Illinois mine and it is expected they will be ready for operations by the first of July.——Colorado men bonded the Washington and other mines near Murphy's and will commence operations soon.——McDonald & Pillsbury made a run of a number of tons of quartz from their mine and the result was satisfactory.——E. C. Loftus will resume work on the Keystone mine at Railroad Flat this month.——Sinking will be resumed on the Cherokee shaft near Altaville. ——The Bald Hill mine, near Albany Flat, owned by F. Brunner, has been pumped out, and it is said development of the mine will begin in the near future.

The *Citizen* says that in the Live Oak mine at El Dorado a rich vein has been discovered at 60 feet depth. The vein is telluride ore 6 feet in width. ——The *Chronicle* says a good body of ore has been found in the Graveyard mine at Rich Gulch. The lead is about a foot wide and the ore is said to go $250 per ton. ——Work is progressing favorably at the Illinois mine and it is expected everything will be ready for operations July 1st.

El Dorado.

(Special Correspondence).—Work has begun at the Griffith mines, Diamond Springs, preparatory to building a 20-stamp mill. A 100 H. P. electric power plant will be installed by the Westinghouse Co., ready for operation Sept. 1st.

The Larkin mine in the same neighborhood will add ten to its five stamps during the summer. At the 100 level the company has a ledge 18 feet wide. At the 300 the ledge is equally wide and of good value. The company's office is at 122 Main St., San Francisco.

The Crown Point and Lone Star properties, Diamond Springs P. O., recently purchased by a Scotch company, is pushing work on the shaft at the rate of 2 feet a day.

The Grand Victory mine, six miles south of Placerville, has its new 30-stamp mill in operation.

The Gentle Annie mine at Placerville is running ten stamps on ore from the 400 level.

The Poverty Point group, on which J. Melton is running a tunnel, has come into good ore and a mill is contemplated.

It is locally reported that the Pocahontas, near El Dorado, will resume operations upon the return of Mgr. Webb from St. Louis.

E. W. Chapman is working fifty men at the Gold Note and Philadelphia properties at Omo, about twenty miles east of Placerville.

The Star Light mine at El Dorado, after considerable dead work, will shortly begin outputting ore and running the new mill.

Placerville, June 5th, '98.

Fresno.

The *Expositor* reports a strike of rich quartz near Trimmer Springs.

Humboldt.

The Humboldt *Times* says that the beach mine at Little River is producing $200 a day.

Kern.

A cleanup of twelve tons of Kinyon ore at the Eureka mill yielded 135¾ ounces, having a value of about $2100.

The 10-stamp mill at Johannesburg has had another accident almost identical with the first one. The engine shaft broke, one flywheel going through the side of the building just as before. The whole engine was a complete wreck. They have now ordered a 20 H. P. steam engine, and will not again start the mill until the new engine arrives. The mill has plenty of ore to run on.— The Yellow Aster Co. has shut down all the mills at Garlock but one, and is having a portion of the output milled at Johannesburg. The Eureka mill in Randsburg is running with ore enough ahead for three months.

The Maggauetta G. M. Co. at Randsburg from 4 tons of ore received $550. The Black Hawk mine near St. Elmo has eight carloads of ore which will be shipped. — In the Visalia mill at Garlock only five stamps are running, owing to the shortness of water. About twelve tons of Rand ore are milled there daily.

Mariposa.

There is little general change in previously reported mining conditions. In Boston Merced stock is quoted at 4½.

Nevada.

D. Stewart of Washington will put a 2-stamp mill on his mine in Canyon Creek. Some of the rock pays $40 per ton.——It is locally reported that the old Erie properties near Graniteville will resume this summer. The property has been idle for several years.

Work at the National mine, near Graniteville, is under the supervision of G. A. Nihell. The property had been idle for some time.

In the Normandie mine, near Grass Valley, a strike is reported of a ledge of fair grade ore.——The Harmony gravel mine, near Nevada City, has closed down. The property has been profitably worked for nine years. The channel for a mile in length has produced about $1,000,000, of which $350,000 was disbursed for labor and supplies. The ground being worked out is the cause for closing down.

Union: C. Waterhouse has men opening the old Knickerbocker mine near Nevada City. It is said he intends to develop it thoroughly. The company is named the Columbus Tunnel Co.

Tidings: Work has begun at the Bismarck and Gladstone mine near Nevada City. New hoisting and pumping works will be erected. ——Poorman & Hastings, who are working their gravel mine near Nevada City, are getting their river claim near Pike City in shape for the summer's run.——A 20-stamp mill will be placed on the Live Oak mine this summer. ——The *Union* says it is locally reported that a new mill will be erected at the Live mine near Columbia Hill. The mine is owned by Dr. A. McMahon and other San Jose parties.

Union: For some time a company has been making test crushings at the St. Patrick mine Washington. It is stated that fifty tons of rock at the Ormonde mill turned out satisfactorily.

Placer.

P. Lawson is developing a quartz property near Alta.

Republican: The Mayflower mine at Forest Hill has closed down, and has thrown a great many out of work.

About thirty men are employed at the Cash Rock mine. The machinery is completed and the flume is rapidly being built.

Plumas.

The Golden Gate mine, near Crescent, struck an ore body from which good assay values are obtained. Several tons of ore are being taken out for a mill test. The property is owned by J. S. Carter and Moore Bros.

San Bernardino.

Ellerman & St. Germain, near Dale, have 200 tons of ore awaiting the completion of the new mills in that locality, of which three are in course of construction.

Shasta.

M. DeWitt struck a rich quartz deposit near Whiskeytown that prospects well in free gold.——J. Brown has bought a third interest in the Enos mining properties.——M. Walton has unearthed a rich find on Brandy creek. The ledge is about 15 inches wide and runs well in free gold and sulphurets.——Knopp & Boyd are developing a property near Centerville that has a ledge from 1 to 3 feet wide carrying a fair percentage of high grade sulphurets.

Sierra.

Supt. M. W. Mather of the Plumbago mine has purchased the Hope mine near Alleghany. The Hope was bonded to a company represented by F. Page, who did considerable work. The Plumbago people will probably begin work on the property shortly.——Work is progressing satisfactorily in reopening the old Kenton mine near Alleghany. Supt. Garnier expects to start the mill shortly on a test crushing.

Goering Bros. are working six men in their mine near Mohawk valley. The water is short and in consequence they pipe only half a day at a time. No general cleanup has been made.——The Upper Dutch mine, near La Porte, got through with the season's work and through the conditions for mining have been unfavorable this year it is believed the company is satisfied with the cleanup.——The Claybank, at La Porte, resumed operations and is running the main tunnel ahead.

Siskiyou.

Bailey & Carrick struck a rich quartz ledge on the north fork of Greenhorn, near Yreka. The ledge is 6 to 8 inches wide. They have been taking out considerable quartz and will soon make a crushing. It is estimated to yield $75 a ton.——The Yreka Co. prospecting in the Humbug mountain, near Yreka has the tunnel about 400 feet, and finds hard base rock.——The people who bonded the property along Yreka creek to mine the same by the dredger process, arrived in Yreka, and will soon have the machinery here to prospect by boring the bedrock at various points along the line of the creek. If the prospects prove satisfactory, the dredging outfit will be brought out.

Journal: Reeder & Brown are meeting with success in their quartz mine on Shasta river, in Fool's Paradise district. The ledge varies from a few inches to 2 feet in width. Some of the quartz is high grade. The miners at Oro Fino, Patterson Creek, Quartz Valley and other sections near the Salmon range have had considerable water lately to prosecute mining with good success. On the summits of the range there has also been a good quantity of fresh snow. D. McCook, at Humbug creek, is getting out quartz in his mine which is of good grade. W. F. Shurtliff is running his mill day and night and has thirteen men at work. The ledge has been paying well. The Golden Star M. Co., on Humbug, will resume work on the old Spencer property by sinking an additional 200 feet.

Reporter: F. Smith is developing a 3-foot-wide ledge on White's gulch in the Salmon River country, from which twenty tons milled $75 a ton. —The Bouvier mine on Slide creek is employing ten men and is in operation day and night.——The Hathaway Bros. are developing a 4-foot ledge on Sugar creek which yields good assay values.——Tuttle & Loverage are working on a 5-foot ledge near Cottage Grove.

News: The Diestelhorst Dredging Co. is operating in the vicinity of Horse creek and averaging $100 a day.— Stone & Nugent on Mill creek are crushing thirty tons of ore from their ledge on South Fork. The plates indicate that it will yield about $20 per ton.—— The Eureka quartz mine on Barkhouse has a tunnel 40 feet on a 14-inch ledge of high-grade ore.——The Minnette B. mine at Nolton has closed down its elevator for the season and is engaged in running an upper stratum of gravel, using two giants.

Trinity.

A good strike is reported from the Johnson & McLeod mine near Trinity Center. The company has thirteen claims in the group. A ledge 2 feet wide, that yields good assays in gold and sulphurets, has been discovered.

Ruhling & Co., near Carrville, are developing a property on which they have a 2-foot wide ledge, from which assays yield $80 per ton. They have ten tons of picked rock on the dump.

Tuolumne.

At the Black Oak mine, near Soulsbyville, on level No. 10, at a depth of 750 feet, 210 feet north of the shaft, discovery is reported of an unusually large ore body, assaying in parts $100 to the ton. The recent flow of water has been overcome by increased pumping facilities.

Sonora *Independent*: The Hibbing property, near Sonora, is under bond and being developed. The shaft is 180 feet, with a drift 110 feet. The vein is 6 feet.——At the Confidence mine, Confidence, the shaft is repaired to a depth of 810 feet. The main level is 2200 feet long. A crosscut from this level has been made which is in 6 feet of good ore.——Stoping is carried on from the 300-foot level in the old Independent mine. The vein shows 12 feet in places. The sulphurets yield $300 per ton. About 1700 tons of quartz is reduced monthly.——The Traylor Co. blue lead at Arrastraville has drifted on a vein for 518 feet. Thirteen tons as a trial lot was crushed and yielded $68 per ton in free gold; the sulphurets are high grade.—In the Little Beauty mine a tunnel has been driven over 100 feet; fifty-seven tons of rock paid $56 per ton. The vein is from 12 to 16 inches in width.——The Sonora, late Scanavino mine, includes the Duffield mine. The two are consolidated in one bond. A tunnel is in the Scanavino vein 190 feet.——The Dreisam G. M. Co., near Sonora, has an incline shaft 270 feet, a vertical shaft 110 feet, which will be connected with the incline and be the working shaft of the mine. The vein is from 18 inches to over 2 feet, and is high grade. The sulphurets are good.——The Carlotta, Cherokee, has a shaft 200 feet deep and drift about 30 feet. The vein is 8 to 16 inches wide.—— The Pennsylvania is owned by the Carlotta Co. This is sunk 200 feet. The vein is from 10 inches to 2 feet wide.——At the Dead Horse the shaft is 1500 feet deep. The vein is from 8 to 12 feet, returning about $8 per ton; the sulphuret general value is $60 per ton, with about 2½ per cent.——The tunnel at the Maine G. M. Co.'s property has reached 155 feet. The vein is said to be 6 feet wide and its value $8 per ton.——The Lost Fox Star Con. Co. have run two tunnels; one is 64 feet long and the other 134 feet. The vein will average 8 feet and runs $12 a ton, exclusive of sulphurets.

Democrat: In the Providence mine, near Sonora, the shaft has been driven 300 feet, and drifting north and south on the vein has commenced. The quartz shows 6 feet, all of which is good milling. At the 150 level ore is being extracted from both drifts. In another month the mill will be completed ——The main tunnel of the Barry is being driven ahead and has reached 155 feet.——The strike in the North Star and Black Warrior is a great one; but as the ledge has not yet been crosscut, the size of the ore body is not known.——Ferral & De Vore discovered a 4-foot vein near the Belleview. The mine will be known as the Bob Gallagher. Development work will begin at once.

Yuba.

Democrat: At the Good Title mine near Indiana Ranch sinking is progressing, the manager having determined to thoroughly develop the lode before adding more stamps.—— At the Abbie mine near Brownsville the stamps are kept busy and the results are said to be satisfactory.——The mill on the Berry mine, near Strawberry Valley, began crushing quartz and has made one good clean-up. This is owned by Chicago men. C. F. Spangler is Supt. The owners have incorporated as the Yuba Gold M. Co.

NEVADA.

A New York company has begun work on the Drinkwater group of mines near Silver Peak in Esmeralda county. The tunnel had reached 340 feet under former workings. There is a 10-foot wide ledge that is said to run $15 per ton.——The Mary mine, an adjoining property, has a ledge 5 feet wide which yields $20 per ton in the mill, and $6 by the cyanide. There are 400 tons of ore on the dump ——The Leidy Bros., in the same neighborhood, are hauling ore from their property to a custom mill which yields $45 per ton.

A. Shallenberger has sold a half interest in six placer claims at Osceola for $1400 cash to A. M. King of Salt Lake. At De Lamar, in the Magnolia, another discovery of high-grade ore has been made.——J. P. Woodbury has been sampling the Douglas tailings near Dayton to see if they can be cyanided. ——J. H. Deegan shipped gold bullion from the Pueblo mine at Denio valued at $7500.——At Stateline the Creole claim has an 8-foot face of ore that will average $12 a ton in gold. The Ophir mine made a three-ton shipment of high-grade ore; work is progressing on the mine.

On the Comstock the Sierra Nevada reports: Riley tunnel—During the week we stoped out from the fourth and fifth floors 175 mining carloads of ore. The average assays of car samples were as follows: Gold $42.96, silver 10 31 ounces per ton. Have hauled to the Nevada mill during the week 234 tons and 600 pounds of ore and milled about the same amount. The average assays from battery samples was $40.30 gold and 10.89 ounces silver per ton. On May 29th shipped 26,700 pounds of sulphurets (undried) to Selby & Co. and received returns from 27,018 pounds of sulphurets which were shipped to Selby & Co. on May 22nd. The cash receipts from the 27,018 pounds were $11,375. On June 2nd shipped one bar of bullion to the United States Mint at Carson, weighing 1428 1-5 ounces, of the bar value of $2503.27. The west crosscut from the south drift from a point 50 feet south from the tunnel has been advanced 24 feet; total length, 84 feet; face in porphyry and clay. On the 900-foot level of the Union shaft workings of the Sierra Nevada west crosscut No. 6, at a point 100 feet north from crosscut No. 5, was advanced 9 feet; total length, 127 feet; face in porphyry, with seams of clay, with a strong flow of water from the face and roof.

In Egan canyon, near Cherry Creek, the Mountain Co. has begun the operation of a cyanide plant and is handling fifty tons of gold ore per day.

OREGON.

The hydraulic plant near Woodville has changed owners and started up again last week.——E. B. Jennings has sold his mine near Table Rock, and the new company will put on a large force to further develop the property.——The mill on La Bellevue mine, near Baker City, has started, and is handling from twenty-five to thirty-five tons of ore per day.——The first cleanup for this season on the Humboldt amounted to $2000. Last year the company made four such cleanups, and they expect to do the same this year.——At the Bonanza mine three men in two days took out over $2000.——The Risdon Iron Works of San Francisco are building a boat 30x70 feet on the river near Tolo, to dredge the river. The machinery consists of three engines, one driving an endless elevator of thirty-six buckets, each bucket of a capacity of 800 to 1000 pounds of gravel, at a speed of eighteen buckets per minute, handling from 2000 to 3000 yards per day. One engine drives the buckets, one a centrifugal pump for washing the gravel, one an electric light plant. The machinery runs night and day. The plant is the property of Hickler & Berrey.

Work on the River Junction placer mines of the Co-operative M. Co., in Jackson county, Watkins district, is developing satisfactory results. At bedrock on the channel they are getting 14 cents to the pan.

WASHINGTON.

In the Butte & Boston mine at Republic an ore chute 200 feet long has been found, from which assays have been made that average $23.50 gold per ton.——In the San Poil the ore body is said to yield $75 per ton.——The Little Cove mine is crosscutting the ledge, which averages from $17 to $20 per ton.——The Uncle Sam M. Co., operating near Bossburg, shipped its first carload of ore. The company owns twenty claims, fifteen of which are on Clugston creek, and the others on the reservation. The ore shipped is mostly lead carbonate.

In the Quilp mine at Republic an ore body was recently found that assays from $8 to $15.

The Golden Harvest mine at Republic, bonded to J. M. Burke and others, has had considerable development work done. The ledge is 8 feet wide and assays from $20 to $40 per ton.

The last carload shipment from the Republic mine returned $233 per ton, of which eleven ounces was gold — In the Rebate mine, near Republic, a rich find was made last week. The property is under bond to J. M. Burke for $30,000.——At the Argenta a 13-foot ledge has been discovered that assays $6.80 in gold per ton.——At the Polar Star mine, Toroda City, three shifts are at work.

BRITISH COLUMBIA.

The main shaft of the Sunset No. 2 at Rossland is down 290 feet. The ore is over 2 feet wide. An average sample of the No. 1 grade of ore yielded $91.31 per ton. The Sunset No. 2 will enter the shipping list this month.—— The Big Three Co. has resumed work on the Southern Belle and the Mascot. On the Southern Belle the tunnel is in over 160 feet, and a seam of good ore varying in width from 6 to 18 inches is being followed. It gives good copper values.——In the Victory-Triumph the ledge has been crosscut and is 9 feet wide. The ore carries galena and copper.

Shipments have been discontinued for the present from the Le Roi, and all efforts are concentrated in developing the property. The main shaft is being sunk to the 700-foot level. ——At the Monte Cristo there are 30,000 tons of ore in the stopes awaiting shipment.

Two options have been signed for the purchase of the Bruce mine, near Trail. One

provides for the expenditure of $30,000 in development work, for which the purchasers are to have 52 per cent of the stock: the second puts the price of the mine at $80,000, with a cash payment of $10,000. Of the eight assays made by the prospective purchasers the highest was $343, the average being $65 ——H. White is again at work on the Paris & Lincoln, near Midway. A 600-foot tunnel is to be run to cut at lower level the big ledge already opened up.

The owners of the Caledonia property near Grand Forks found a 3-foot seam of copper ore that assays an average of $50 in all values. ——At New Denver a good strike is reported in the Fidelity mine.——The Second Relief, near Erie, has over 1000 feet of work, and a large amount of ore on the dump, which will be shipped as soon as the wagon road is completed. This ore has been taken from a ledge which varies from 18 to 20 inches. The values are in gold, running from $50 to $70.——The Nancy C. has a body of ore running from 20 inches to 3 feet of good value. Assays from this claim run from $20 upwards.——Near Cascade City, Forrest & Good have discovered copper-gold ore.

The North Star mine, in East Kootenai, a galena or silver-lead ore, from shipments made of about 7500 tons to the smelter, averaged $60 a ton. The cost of shipping, smelting and paying duty on lead going into the U. S. was about $40 a ton. The company contemplates erecting a smelter at the mine, and the total cost of mining and smelting will be under $10 a ton. The development work consists of about 2000 feet of drifts and shafts, about 1400 feet of which is said to be in solid ore, varying in thickness from 6 to 60 feet.——The second payment of $5000 on the Lily May at Rossland has been made. Besides the cash payment, the Lily May will also receive 42,000 $5 shares in the British Canadian corporation. Besides the Lily May, the new concern purchase the Lily May fraction, the Black Horse and the sixteen properties held by the Fourteen Gold Mines Con. Co., all in the south belt.——During May there was cleared through the Kaslo custom house 930 tons of ore valued at $67,735, containing 696,086 pounds of lead and 94,052 ounces of silver.

Work on the smelter at Trail goes on. Three roast heaps of crushed ore are burning, and last week the returns from Rossland ore were over 800 tons. The smelter people have arranged for electric power to operate their entire plant.

There were shipped from Sandon between Aug. 1st last year and May 27th last 22,993 tons of Slocan ore. Of this total the Payne mine accounted for 10,010 tons, Ruth 5374 tons, Slocan Star 3247 tons, Idaho 1864 tons, Last Chance 1384 tons and Reco 1128 tons.

At the Pothook copper claim on Coal hill, near Kamloops, a series of crosscuts reaching over a total length of some 2000 feet, is stated to have exposed the fissure for that length. The width, as exposed in these crosscuts, is from 100 to 125 feet or more. A shaft has been sunk over 100 feet perpendicularly, with a crosscut at 80 feet either way. No hanging wall has yet been exposed. The footwall is ordinary country rock, a much altered gabbro. In the crosscut are three streaks of copper ore, composed of native metal in flakes and plates, of a thickness reaching one-eighth of an inch, with considerable grey copper. The ore is stated also to carry some $7 in gold. The shaft is a double-compartment one, of a size to permit of depth being obtained, and the timbering is first-class.

Work will be resumed shortly on the Waneta and Trail Creek properties, the Copper Bell, the Copper and Copper Glance, near Rossland. The present work includes a shaft on a copper and galena vein, and a tunnel and a shaft on a copper ledge.

The force at the Ruth mine, Slocan, has been cut down to forty men and no more shipments will be made until the roads are passable.——The Slocan Star is increasing its force.

ALASKA.

Alaska *Miner*: The latest organization to do business in Alaska is the American G. M. Co.; to acquire the property and assets of the Nowell G. M. Co. at Sheep creek, the Basin and elsewhere in Alaska. At Sheep creek the properties will shortly be opened up. A twelve-drill compressor will be put in there. Work will be pushed. The hydraulic placers of the Nowell Co. are at work. Nineteen men are employed.

THE KLONDIKE.

Steam and gasoline launches are now plying on Lakes Lindeman and Bennett, between the foot of the Summit and Cariboo crossing. There are two steam craft operating on Lindeman and a gasoline launch on Bennett. Trouble is caused by jamming of floe ice at the foot of Bennett and the head of Tagish lakes, boats being frequently crushed to splinters.

Mackenzie & Mann, the contractors who were to build the railroad from Glenora to Teslin lake, and in this way open up what is termed the all-Canadian route to the Yukon, have abandoned the scheme and will recall their engineers and workmen, who were sent up the Stickeen river before the ice was out.

Navigation has opened up on the chain of lakes between Chilkoot and White passes, and boats are now passing down the river on their way to Dawson. Lake Bennett is free from ice, except a few floating floes. The ice is still firm on the upper end of Lake Lindeman, but does not impede progress down the Yukon. Most of the boats were built either on the lower end of Lake Lindeman or on Lake Bennett. Many of the builders have been waiting for the break-up since last December. Others who have started are new arrivals, who purchased boats at the lake and bundled their outfits into them. At Cariboo crossing the mounted police have another station, where every boat that goes down the river is numbered. The number is painted on the boat's side in big letters. The occupants are required to give their full names and their former residence. This gives the police a record from which accurate information can be obtained in case of accident. The last advices from Cariboo crossing are under date of May 26. A letter received at Skaguay, under that date, said that nearly 800 boats had passed through. Estimating the number in each boat at four persons, 3200 have passed down.

UTAH.

The Martha Washington mine at Silver City made a shipment of high-grade ore.——The tonnage for June of the Grand Central at Tintic, it is said, will reach sixty cars.——The shaft on the property of the Camp Floyd Co. has reached 290 feet.——The Red Wing at Bingham has let another contract for 50 feet of work on the tunnel, which has been driven 350 feet.——At the Four Aces the ore body has reappeared on the drift off the 600 level and shipments will at once be resumed. The shipments from this drift on the start yielded seventy-seven ounces silver and 49 per cent lead, $52 net per ton ——It is stated that the Sunbeam mine at Silver City has 100 tons of ore exposed that will yield $10,000.——The Annie Laurie at Gold Mountain has found an ore body that assays from $52 to $308 in gold per ton, while in addition is a fair showing of silver. The ore was encountered in the tunnel 250 feet from the mouth, where 12 feet of ore has been exposed.——The Tintic *Miner* says that at a depth of 106 feet in the Mountain View there was struck a vein of highly mineralized black quartz.——Hall & Yard of Philadelphia have taken a year's lease on the Gold Blossom in North Tintic, and have a small force of men at work prospecting.

The ore output for May from the various mines at Bingham was 3463 tons.——The Jordan & Galena is crushing 140 tons per day.——The Sunbeam mine, Tintic, is shipping ore that runs $100 a ton in gold, copper and lead. ——The tunnel in the Herschel mine at Mercur has reached 2250 feet.——The Darlington at Alta made a shipment of fifteen tons that shows 13 per cent copper and eighteen ounces silver per ton.

A shipment of auro-cyanides from the Mercur mine amounted to $25,000.——The Horn Silver shipped six cars of ore running in silver and lead.——The Executive Committee of the International Mining Congress, to be held at Salt Lake on July 6, 7, 8 and 9, aided by the local committee, have completed arrangements to entertain 1000 delegates. Up to date 600 delegates have been certified to the secretary, and more are expected. The delegates so far certified are from twenty-four different States, with Colorado yet to hear from. The *Tribune* says: "The business sessions will be in the interest of the mining industry, and will consider such questions as the establishment of a national department of mines, the chief to be a Cabinet officer. Hon. Lafe Pence will make a report upon this subject. They will also consider revision and codification of federal mining laws; establishment of branch mints and assay offices; laws of apex and extra lateral rights; mine inspection; taxation of mines; railroad relation to mineral development; the status of labor in mines, and other issues that may arise. The Spanish land grant question will be discussed and recommendations made. Papers will be read on technical and practical subjects. The citizens of Salt Lake have added a social feature to the programme. A reception will be given at Saltair. Excursions to the gold camps will be arranged for the delegates—one to Mercur and another to Eureka. Utah will have on exhibition specimens of its various resources that will add much to the interest of the occasion."

Mercur *Mercury*: Since connection was made between the tunnel and the upper workings in the Geyser-Marion three shifts have been put on, and the work is going ahead at a more rapid rate. The mill is treating more ore, the drift from the mill tunnel to the Marion workings is being pushed ahead, and exploration on the upper vein is proving the magnitude and value of the recent strike.——Assays have been made recently of the ore in the Columbia Co.'s property and values were found to run from 40 to 100 ounces silver, 12 to 32 per cent lead and a small amount of gold. The company has 3 feet of ore in the drift.——The Overland shaft has reached a depth of 250 feet and is going down at the rate of 3 feet per day. ——At the La Cigale drifts are being run on the third and fourth levels. The Scheu shaft is in ore of good quality.——Ore has been found at the South Daisy at a depth of 65 feet. The work of developing will be pushed.——There are prospects that operations will soon begin on the Eagle group ——Work will soon begin on a pipe from the Oakland shaft to the Daisy mill, two miles.

At the Germania smelter five new furnaces are started, giving the plant a total of fifteen, with a capacity for treating 195 tons of sulphide ore daily, while, with the auxiliary roasters, the total advanced to 265 tons of this class of ore a day.

IDAHO.

(Special Correspondence).—Boise basin is a depression among the mountains of the Summit and Payette ranges, and is from thirty-five to forty-five miles north of Boise City. It is nearly circular in form and has an altitude of about 4000 feet above sea level. The mountain ridges which surround it rise from 6000 to 8000 feet above the sea. The surface of the basin is broken, hilly, well-timbered and is about twenty-five by thirty miles in extent. It is drained by a system of small streams which finally converge into one stream that leaves the basin and empties into the Boise river. The principal streams are Granite, Wolf, Grimes, Elk and Moore's creeks, whose wide, gravelly beds and bars still bear evidences of the extraordinary activity which prevailed in this basin from 1864 to 1870. More than $40,000,000 in gold was taken from these creeks by hydraulic methods within the period named. The pioneers in this important epoch of Idaho gold mining were Californians, many of whom are still residents of the historic basin.

According to geological reports on this section, the gravels of these creeks are made up of granite sands and rounded pebbles of quartz, with disintegrated granite-gravel extending from the streams several hundred feet up on the hill slopes, which has made it possible to extend hydraulic work far into the banks.

At Placerville, which is on Granite creek, the beds of sand and gravel are from 20 to 40 feet deep, and this is the point at which the Bedrock Dredging Co. are building a large dredging boat of the New Zealand-Bucyrus type. Their dredge will be very heavy and is about 50 by 150 feet in size and is intended to handle about 2500 yards of material in twenty-four hours. At present the machinery is being put in and excavating is being done for water to float the boat. They will doubtless be ready to operate within a month. While a great deal of the material composing these beds and bars, workable by the modern hydraulic dredge, constitutes that which was washed down by hydraulic giants in former years and therefore robbed of its greatest values, there seems no doubt that there still remains a general average of fine and coarse gold rich enough to make good profits when the material is handled rapidly and in large amounts.

On Grimes creek the Basic Co., composed of Eastern capitalists, is building a flume, by means of which a water pressure of about 350 feet will be obtained twelve miles below Centerville. At this point electric power will be generated for the purpose of operating the dredge at Placerville and other dredges which the company contemplate building.

On Moore's creek, two miles below Idaho City, the Risdon Iron Works is constructing a dredge for the New England Dredging Co., whose holdings along this creek include a large area of placer bars which have never been worked. Their dredge will be 30x76 feet and 5 feet 6 inches deep to drain 2 feet 9 inches of water. It is stated that it will handle 2500 yards of gravel per twenty-four hours. It is expected the dredge will be operating in about a month.

Mr. T. F. Van Wagenen, formerly of Telluride, Colo., is manager of the dredging and electric-power enterprises of the Basic Co. and the Bedrock Dredging Co.

Mr. Rupert Winters is manager of the New England Dredging Co.'s work.

At Granite creek, below Quartzburg, a considerable amount of work is still in progress by the ordinary hydraulic method, as is also the case near Centerville, Pioneerville and above and below Idaho City.

At Quartzburg is the location of the old Gold Hill quartz mine, now tied up by litigation, but which operated at a big profit for about thirty years. Above and adjoining the Gold Hill is the Iowa group, owned by D. E. Coughanour and associates, which is being well developed. A 10-stamp mill on the ground is to be supplemented by a cyanide apparatus. Mr. Coughanour owns a 20-stamp mill at Silver mountain. This will be moved to Quartzburg and added to the Iowa mill.

The Newburg, two miles from Quartzburg, is being developed from two tunnels, one of which goes in on the vein. The property has about 500 feet of tunnel work done. About 550 feet below the mouth of the tunnels is the forty-ton Bradley mill, which operates a little on the plan of the Chili mill, the crushed material passing from the crushers through screens over stationary plated tables. This property belongs to Denver parties. C. H. Clemans is mill superintendent and George Barry mine superintendent. The mill is said to work satisfactorily.

The Morning Star lode mine, situated in the vicinity of Pioneerville, is being developed by Wm. Sweet, who finds the ore a free-milling, porphyritic quartz containing fair values.

Near Centerville the Twin Sisters quartz mine is being developed under the management of A. C. Fralik. A 10-stamp mill is being built on the property.

The placer property on Elk creek, recently sold by K. P. Plowman to R. J. Anderson and associates, is being put in condition for further work.

The future prosperity of Boise basin depends upon the success of the extensive dredging enterprises being launched and the success of quartz mining in the contiguous mountains. Various parties have been successful in enlisting a good deal of capital in both kinds of work. The dredging companies are exhibiting a great deal of energy, and the prospects for Boise basin are growing brighter.

WASCOTT.

Idaho City, Idaho, June 2nd, '98.

The Upper Boise Hydraulic Co. near Boise is running two giants. They have been stripping a large area of gravel which runs in good values. The company has constructed about 9000 feet of ditch, two-thirds of which has been blasted through solid rock. The ditch carries 3000 inches of water and a head of 250 feet is secured.——Two contracts have been let for development work on the Paymaster mine at Murray, each for a tunnel of 100 feet.

It is locally reported that work on the Waverly mine at Florence will be resumed. The Waverly was closed down last winter. ——It is stated that the Double Standard, one of the claims of the Red Bird Co., is looking well with a 3-foot vein of milling ore.——W. F. Howard, near Mountainhome, has resumed operations on the Bonaparte mines and will begin crushing ore shortly.——At Blackbird Rose Bros. have opened a body of sulphides containing streaks of native copper.——The Queen of the Hills mine is crushing fifteen tons of ore per day.

At Saltese, G. P. White is developing a property in which he has a 5-foot wide ledge, running from 30 to 50 per cent copper, carrying more than enough gold to pay the cost of mining.

The Brown Bear group of mines in Blackbird district, near Salmon, has been bonded to the Glasgow Expl. & D. Co. of Scotland.

MONTANA.

Lueck Bros., leasing on the Bamboo Chief mine near Virginia City, shipped three tons of ore which assayed $500 to the ton. The mine has been worked twenty years.——Conway & Whitmire shipped thirteen tons of ore from the Navahoe mine near Virginia City. ——Holmes & Hayward, who have a lease and bond on the B. & L. mine near Madison, are working four men. They have a tunnel 200 feet, and say they are getting good assays. ——Connor & Pyle have taken a lease on the O'Brien vein at Neihart. They have a good body of ore and will soon make their first shipment.——Mr. Savage is working a force on the Sunnyside at Washington Bar, doing development work chiefly, and has out a pile of ore which he expects to ship as soon as the roads get in condition to haul over.

The G. & B. mine at Clancy made a two-carload shipment of ore.——Freyler Bros. have taken a bond on the New Stake mine and begun to unwater it.——The old Gregory mine is again making occasional shipments. ——Buzzard & Co. made a carload shipment of ore from Navahoe.

At Sheridan the Montana mine has considerable ore on the dump. The mill on this property will be started shortly.——H Kallis shipped five tons of ore from the McKinley mine.——The Ruby Placer Co. on Wisconsin creek is hydraulicking. They have two giants in operation.——W. McDougal, leasing on the Keynote mine, made a shipment of fourteen tons of galena.——Steiner Bros. made a shipment of 360 sacks of ore from their mine. A shipment made a few weeks ago netted the owners more than $50 to the ton.——Armour & Jeffries made a shipment that netted them $250 a ton.

Lewis & Quillus shipped two cars of ore from the Broadwater mine at Neihart.—— The Hidden Hand owners shipped a carload of good ore. They have several carloads more ready to ship.——The Deer Lodge M. & S. Co. made a carload shipment of high grade ore. ——J. H. Riley will begin soon the season's operation on the Way Up mine at Libby. The work on the property will be pushed. A contract will be let at once for 500 feet of development work.

L. C. Parker of Garnet has cut the Nancy Hanks lead on his claim at a depth of 150 feet. The Shamrock and the Nancy Hanks are the two great producers of the camp and the lead which runs through both of them is about 3 feet wide. The ore is said to run over $100 to the ton in gold and carloads to the smelter net the owners from $1300 to $2000 to the car. The ore is hauled to Bearmouth station and shipped to Butte. The strike made by Mr. Parker has created renewed activity in the district and many prospectors are at work in the surrounding hills.——The upraise in the Daisy mine at Cooke connecting the two tunnels has been completed. Enough ore has been blocked out in the mine to keep the fifty-ton concentrator running four years.

For 1897 the Exploration Co., Ltd., a London corporation which holds in Colorado, Montana and Mexico, has given out a statement of its operations and earnings. The balance sheet shows an issued capital stock of $5,500,000, a reserve of $2,000,000 and credit balances equal to $835,055.

The income account for the year shows a total of $981,995 and the expenses footed up $190,725, showing a net profit of $791,270. The directors recommend a dividend for the year equal to $187,500, or 12.5 per cent on the par value of the shares. The dividend for 1896 was 10 per cent.

The report says: "In the opinion of the directors, the company's assets are of greater value than the amount stated in the balance sheet, and the directors have adhered to the policy of spreading the risks taken as widely as possible. The company still holds a considerable interest in the Anaconda Copper M. Co., and the reports received from the mines continue satisfactory. The Grand Central mine, a source of anxiety for some time, is developing well, and improved profits are being made. The business of the company during the year has brought with it some disappointments, which have, however, been more than counterbalanced by successes."

The April returns of the Montana M. Co. state the total output for the month was: Gold, 2000 ounces; silver, 8540 ounces; obtained from 6400 tons of ore crushed and 4305 tons of tailings from the dams. The treatment of these tailings cost $5609. The value of the output is estimated at $44,500. The various expenditures amounted to $50,300, leaving a net loss of $5800. The tailings plant resumed work on April 18.

The Butte & Boston smelter and concentrator are both at work on the ores from the Boston & Montana mines, though some Butte & Boston ore is being reduced. Some custom ore is also being handled though the great bulk comes from the Boston & Montana Co. This company is having its plant at Great Falls enlarged so that its capacity will be increased one-third.

The Washoe Co. is reported to be preparing to sink a shaft 1000 feet deep on the Hesperus lode claim. This is one of the several claims including the Yellow Jack, the Colorado fraction and the Lizzie lode claim which came into possession of the Washoe Co. several weeks ago. It is now stated that the whole consideration was $400,000 for all the claims, a part payment being made on each and a bond taken for one year, in which time the claims will all be thoroughly explored.

There are about 600 gold mills in present operation in Montana with an aggregate of nearly 7000 stamps.

WYOMING.

At Grand Encampment, Gleun & Hood are working the Iron Masque mine with success. ——F. Rock is developing a copper property near Beaver.——Jones & Williams are working a lead and silver property at Spring Creek. They made a carload shipment, for which they received satisfactory returns.

The *Boomerang* says Denver and Laramie

parties have located thirteen and a half miles of placer ground in the Platte canyon, North Park, Colo., and in Wyoming. Development work will begin at one.

SOUTH DAKOTA.

D. C. Boley, near Deadwood, is developing a fair-sized body of shipping ore.——The American Express mine has been sold to Pennsylvania people for $25,000.——On the Garden City mine Burns & Little are taking out a fair quality of shipping ore.

COLORADO.

BOULDER COUNTY.

The Enterprise at Eldora has started up again under the old management.——The Village Belle shipped their fourth carload of ore.——The Dimmick mill at Ward is running on tailings from the Utica mill.——The Mountain View is down 50 feet and has a 5-foot vein, running $78 per ton.— The Enterprise at Eldora is reported sold to Mitchell & Bailey for $60,000. The new management will put a large force to work soon. The shaft is 100 feet deep and in the sinking of this several thousand dollars was taken out.——The Revenge made their first shipment. This is rapidly developing into a mine.——On Eldorado mountain in the Antietam a larger force has been put to work.——The Newmarket people at Ward shipped two carloads of ore.——A tunnel is being run at Eldora by the owners of the Ohio No. 2. They have 6 feet of sulphide ore that runs $12 60 per ton.

CHAFFEE COUNTY.

Bugbee & Page are working on the White Crown near Whitehorn. They have a vein of hematite and quartz that assays $24.80.——A. Johnson bought the controlling interest in the Prairie and will put on machinery at once and push development. Two carloads of ore are on the dump ready for shipment, that runs from two ounces to five ounces in gold per ton.——Among the recent strikes is that on the Vulture on Cannon mountain of an 18-inch vein that runs $80 in gold to the ton.——Col. Hogle's force has been pushing development in the eastern side of the district. Ore from the bottom of the shaft assays from $40 to $60 in gold to the ton.——The old Belle at Granite is being worked by lessees, who are doing considerable development work; they made three shipments which gave them $120, $140 and $160 per ton.——Lessees of the New Year at Granite have a shaft 103 feet deep. One shipment of ore gave $120 per ton. They have an 18-inch pay streak and about 3 feet of mill dirt.——The Sedalia mine near Salida has found a new ore body. This is a copper property and said to be the only one in Colorado worked exclusively for copper.

In the Elder lode, on Cameron mountain, near Whitehorn, the shaft is 80 feet and shows a vein 8 feet wide. A recent mill test gave $18.80 in gold to the ton.——Three of the properties in the Klondike section made shipments, the L. S., Holdredge and Domingo. If ore holds up to the assay tests it will net close to $100 to the ton. In this neighborhood lies the Nebraska tunnel, in which was found a 3-foot pay streak. This tunnel has cut through a 2½-foot vein that gave a mill run of $62 to the ton.——A new copper streak 5 inches wide has been opened on the Gold Bug, in the Turret section. This streak also carries gold, ranging from $34.80 to $87.60 to the ton. A two-car shipment was made.——The Ethel S. tunnel has resumed work. It has a number of copper dykes. Some of these dyke croppings run as high as 30 per cent copper, and all the veins carry gold. An assay on one of these veins gave 37½ per cent copper.——F. J. Martin has bonded and leased his Rudolph M. to St. Louis people for $10,000. Assays average between $20 and $25 in gold to the ton. The vein is some 3 feet wide, with more than a foot of pay.

CLEAR CREEK COUNTY.

A crosscut in the Griffith mine near Georgetown opened a fine body of ore carrying a large per cent of lead.——The Topeka mine's daily shipments reach forty tons of medium grade milling ore.——The Bon Ton mine at 265 feet has a 2½-foot body of mill and smelting ore that gives $87 per ton.——Much activity is noticed in the Freeland district. Capital and an experienced manager have taken hold of the Lone Tree and are putting it in shape to resume production.

EL PASO COUNTY.

A strike has been made in the Morning Star, Cripple Creek, belonging to the Enterprise Co., on Raven hill. It is worked under lease by Carruthers & Chilcot, who will open the property to a depth of 200 feet before starting to make regular shipments. In their 100 level they have 18 inches of ore that assays from $20 to $70 a ton.——On the Ingham the company has reached the vein at 100 feet below the tunnel level. A shipment of forty tons was made. The lessees continue to produce about twenty-four tons a day.——The station for the fifth level in the Gold Coin is finished and the crosscut to the vein has started. The mine is shipping its usual 130 tons a day and the grade is improving.——The Columbine-Victor tunnel is 1600 feet into Squaw mountain and progressing at the rate of 7 feet a day.

The output of the mines of the Cripple Creek district for May is estimated to be 34,000 tons of all grades, the gross value of which is $1,250,000.——The Isabella Co. is not in rich ore, so far as is known, but Mgr. Kilburn is doing a large amount of development work. In the neighborhood of 175 men are on the payroll. Enough ore is being taken out to meet the running expenses.——J. O. Hardwich sold a controlling interest in the Montreal Co.'s stock to Eastern people for $50,000, or 10 cents per share. It was a cash transaction. The Montreal Co. owns a number of claims on Copper mountain and Mineral hill. The principal one is the Fluorine.——The Elkhorn, on Carbonate hill, made five shipments the past few weeks, the lowest running better than $50 and the highest over $200.——The Portland, Gold Coin, Independence, Strong, Granite, Dead Pine and two or three others have marketed more ore in the last thirty days than ever before in their history, with the possible exception of the Strong.——In the Coriolanus, on Battle mountain, in a new shaft, there is 6 inches of talcy ore that assays from ten to seventy ounces. The low grade stuff runs from $200 to $300 per ton.——F. Pettingell bought the Clyde mine at Victor for $25,000 cash.——J. O'Hanlon of Pittsburg bonded for two years at $125,000 the Colorado City mine, Cripple Creek, and will erect a plant to sink the double-compartment shaft to depth. The property has a good shipping record.——After sinking a shaft 300 feet, the lessees on the Temoni, in a surface trench about 50 feet from the shaft, opened up a wide body of ore assaying as high as $40 per ton.

The Anchoria-Leland has opened the south extension of the Johnson chute which gives 80 feet of stoping ground in a body of ore that ranges from 1 to 4 feet in width of a better grade than anything the mine has produced for several months past.——The Anaconda Co. holds its production of mill ore steadily at 800 tons a month.

Smith & Watson shipped the ore in their lease on the old workings of the World's Fair; 6 inches of the ore streak will run from $800 to $1000 a ton.——The Midland Terminal has completed a sidetrack at the Elkton ore house, so that all mineral mined in that property is now loaded directly into the cars. The Elkton at present is shipping on an average of 80 tons per day.——The annual report of the Portland mine of the Cripple Creek district for 1897 shows that the company extracted 18,852 tons of the gross value of $1,117,642.65. There were 58,734.74 ounces of gold and 5543.8 ounces of silver. The treatment charges amounted to $184,003.61. The company paid dividends to the amount of $30,000 per month —$360,000 for the year, and the total amount paid in dividends up to the first of the year was $1,267,080. The amount of monthly dividends has been increased to $45,000 this year, and up to the present time $1,403,000 have been paid in dividends. The company has a fund of $350,000 in the treasury.——The Pinto, worked by the Pinto Leasing Co., shipped 60 tons of $100 ore. —— For May the several plants in the Cripple Creek district handled 25,100 tons of ore that had a gross value of of $665,000. The tonnage sent to the smelters was fully 9,000 and a low estimate of its value is $66 per ton, which means $585,000 gross. The tonnage handled by the different stamp mills was so small that it is not given in the total. A few hundred dollars of placer gold was also taken out of the ground in the northern portion of the camp.

One of the features of the month is the unusually large production of the big properties, and another is the high average per ton of the mill ore treated. This average, which generally runs between $24 and $25, was increased to over $26, according to the official figures from the mills.

Johnson & Co. found good results of their their work on their Gold Sovereign lease. The only difference in the ore from the upper workings is a change from sulphides to oxides. The rich seam of talc in the upper level has been transformed into quartz upon the acquisition of depth, but retains its values in sylvanite. The general average of the ore is from twenty to twenty-six ounces. There are now five producing shafts on the Gold Sovereign ground and the company has received $9000 in royalties the last four months.

The Lucky Guss M. Co. owner of the Lucky Guss mine, Cripple Creek, has taken the mine out of the hands of the lessees. For several months past the mine has been worked by the miners formerly in the employ of the company, to whom it was indebted for back wages and, being unable to liquidate, allowed the men to take out ore until the indebtedness was cancelled. The employes were much more successful than the company in finding rich ore, and not only have all back wages been paid, but the men have been averaging over $6 per day for their work for several weeks past. They closed their lease with a final shipment of twenty-five tons of three-ounce ore.

Denver *News*: The increase in the quarterly dividend of the Victor from $50,000 to $100,000 has created comment among mining men. The reserve fund is not far from $250,000. This will leave $150,000 in the treasury. The ore is in sight, and it is only a question of cars to transfer it to smelters and mills. With rails laid to the ore bins from the Florence & Cripple Creek railway, the Victor is now in position to keep up a production averaging from 110 to 155 tons per day.

GILPIN COUNTY.

During May there were shipped from Black Hawk 256 cars of ore and concentrates, aggregating 4096 tons.——The shaft in the Centennial mine is down 220 feet. When the water is out drifts will be started. They are in a crevice of low grade white iron.——The water which has obstructed operations in workings No. 5 of the Bobtail at Black Hawk has been drained and five power drills are at work. The vein will be cut 350 feet deeper than the old work. Other properties in that section will also be drained through the same channel and new ground be in condition to work.

The Victoria M. Co. has some lode and placer claims in Moon gulch which it is developing. Lessees on some of their placer ground are taking out coarse gold.

GUNNISON COUNTY.

The Jimmy Mack mine, in the Tin Cup district, after years of idleness, is about to resume work. So soon as the mill can be made ready, work will commence on the bodies of low-grade ore. The mill is being modernized so as to make closer savings. It will also treat ore from the Gold Cup mine.

A test made on ore discovered near Marble runs $280 per ton in gold. The streak is 6 inches wide.

HINSDALE COUNTY.

Boston capital has purchased the Lellie and Baltimore claims near Lake City. The claims have shown some good ore of gray copper, carrying gold and silver. It is intended to start work immediately with as large a force as can be used.

LAKE COUNTY.

The Colonel Sellers of Leadville is shipping six carloads of ore daily.——The Garibaldi tunnel has reached 4000 feet. So far the only body of ore found is an iron-sulphide, too low grade to pay. A small streak has been opened of ore running $40 in gold and about $10 in copper.——The iron-sulphide ore of the Mike and Starr carries ten ounces of silver, some gold and copper and about 35 per cent iron.——The Bull's Eye, belonging to the Iron-Silver Co., is shipping five carloads of ore daily that runs 50 per cent iron and six ounces of silver.——The Ibex mine has large bodies of copper-sulphide ore which makes a good concentrating material. The company propose changing their cyanide mill to a concentrator.——The result of the Home M. Co.'s operations will be to add 850 tons to the daily output of the gold belt at Leadville, permit the resumption of operations in several large sulphide producers and give employment to hundreds of miners. The full amount, $50,000, to perfect the organization, has been subscribed.——The Monarch Co. is employing thirty-five men; shipments are steady.——The Dyatt lease on the Gallagher continues to ship 100 tons daily of a good grade of sulphide.——High grade chlorides have been found in the Elk mine. The streak is 2 feet wide and is high grade lead, studded with chloride, which is 75 per cent pure silver.

Paddock & Fogel, on the Tucson shaft of the Iron Silver mine, at a depth of 640 feet, opened up a body of sulphide and are making shipments.——The daily output of the Cyclops and Marian leases of the Small Hopes Co. amounts to 250 tons per day.

OURAY COUNTY.

Development work on the Kentucky Giant has exposed a new ore body said to be of good values.——The installation of machine drills soon to commence at the Treasury tunnel awakens interest second only to the Meldrum tunnel. The Treasury Tunnel, M. & R. Co. is a corporation capitalized for $500,000, composed of Pennsylvania capitalists. The tunnel will be 7920 feet long, 8 feet wide and 8 feet high, and will run from a point near Ironton under Commodore peaks to the head of Silverside basin. The veins which will be cut are the Bob Tail, Virginius, Tom Boy, Argentium, Columbia and Japan. The above mentioned veins have already been discovered. It is estimated that two and a half years will be occupied in construction. The tunnel will cut the crest of the range nearly 3000 feet from the surface, and deep mining will be one of its principal objects.——Shipments from the O. & N. continue and the values are satisfactory. Sixty-five men are employed and the output averages four cars of high-grade ore per week.——Work is soon to commence on the Bachelor No. 2, a claim on Mount Hayden. Some good ore is found on this property.

PARK COUNTY.

Development is progressing on the Mabel Grace, in the Freshwater district. The new machinery is all in place. In a short time the shaft will be going deeper into the ore bodies that have already been found.

A shipment of 4858 pounds of ore from the King Solomon mine near Como returned $110.67 per ton. The values were 5.49 ounces of gold and 1.5 ounces of silver per ton.

PITKIN COUNTY.

The Tycoon mine, which has been closed down for a long time, is about to start again under the management of Aspen parties.

SAGUACHE COUNTY.

H. Heukauffer is steadily working his Garfield mine near Crestone, leaving the ore body standing. He has 400 feet of ore exposed that will average $40 per ton gold.——The Commodore of Creede is preparing to double its output. They are getting the fourth level in shape as fast as two shifts can do it.

SAN JUAN COUNTY.

The daily output from the North Star mine near Silverton averages fifteen tons of good mineral. About twenty men are employed.——The Veta Madre group has opened an ore body that yields two ounces gold per ton from wall to wall.——Ten stamps of the Alleghany 20-stamp mill near Telluride are dropping on ore from the Contention group, owned by E. A. Hockley & Co. By mill runs the ore has averaged $35 per ton in gold; fifteen men are employed on development work. —— T. J. Hurley of New York has made arrangements with an English company to operate the Occidental mines of the San Juan district. Tests are to be made on the large body of low grades exposed, and if development proves their permanence, the proper method of treatment will be decided on and a large plant erected.

Four cars of ore, comprising forty tons, were shipped from the Esmeralda mine, near Silverton. The ore will run $50 a ton in gold.——The Menominie mine has resumed work.

SUMMIT COUNTY.

Great activity is shown in the placer development of this county. The Pence-Miller Placer Co. own 1600 acres of ground near Breckenridge and are employing 112 men and thirty teams on the ditch. It is expected the hydraulic elevators will be at work shortly and will continue during the season.——The Mountain Pride is employing twenty-five miners and shipping twenty tons of smelting and ten tons of concentrating ore weekly. The shaft is 500 feet deep and cut by a 700-foot tunnel at 145 feet.——A 2-foot body of iron manganese has been struck in the Iron Mask. In this mine native sulphur, 75 per cent pure, is occasionally found near the lead ore.——Over 600 tons of smelting ores and concentrates were shipped from Breckenridge last month.

There is a project on foot in Summit county to sink at least 1500 or 2000 feet with a diamond drill for the purpose of obtaining a knowledge of the formation below present development and its value with reference to mineral deposition. There has been no deep mining in Summit county because of the wealth found in the upper strata.

SAN MIGUEL COUNTY.

The Tomboy mine, Telluride, shipped two gold bricks last week amounting to 3000 ounces.——The Iron Springs mine at Ophir is making regular shipments.——The Shoemaker mine is making shipments of high grade free milling gold ore.——Southard & Co. are working the Gold Crown.——McDougle & Co. are taking out good ore from their lease on the Globe.

In Marshall basin, near Telluride, a strike of rich ore was made in the Little Mary mine. The ore streak varies in width from 8 to 18 inches. The drifts will be pushed and a shaft sunk on the vein.——In the Elkhorn M. Co.'s Sunshine group an ore body has been found that contains 2 feet of shipping ore. The first carload netted $65 per ton in gold, copper and silver.

NEW MEXICO.

The Aztec, near Elizabethtown, has again resumed operations and is producing gold, after lying dormant for several years. This property is in the Ute Creek district and is equipped with a large mill, tramway, etc. Its production has been from a depth of less than 300 feet.——The Gold Nugget placer mine at Elizabethtown has resumed operations.——At Pinos Altos six quartz mills are running full capacity.——The old Gypsy mine at Kingston is being unwatered.——After one year's idleness twenty men have been put to work on the Black Copper mine, near Franklin.——Fifteen tons of ore from the Gold Standard mine at Golden yielded $600.——At Santa Rita Ashton & Roach have an ore body that assays 10 per cent copper.——The Santa Rita Copper and Iron Co. are shipping three cars of iron ore per day, and a large amount of copper ore. They employ eighty men in the mines.

The San Pedro copper smelter at Las Vegas has begun operations. The capacity is 200 tons per day, and the adjacent mines can supply material for its full capacity.——The Crown Point, at Golden, shipped 100 tons of ore that netted $10 per ton.——The Midnight lessees, at Red River, from a four weeks' run, sent out twenty-eight ounces of gold and concentrates.——The Iron placer has commenced operations for the season.——The John Bull tunnel is in 200 feet.——A mill for the Ione property is contemplated by the operators, Mode & Penn, Red River.

The Old Reliable mine at Golden has four 80-foot shafts all in mineral. They crush fifteen tons per day of $8 ore.

ARIZONA.

At Tucson last Wednesday the case of the United States against the Copper Queen M. Co. was determined in favor of the defendants. The Government claimed $183,000 for timber used by the Copper Queen. This was the third trial. The decision is considered fair and favorable to mining interests.

At Prescott the Gold Standard group in the Santa Maria district was sold to J. B. Greenhut and others of Peoria, Ill. They have been working the property under bond for some time and have a mill and cyanide plant in operation. The bond had a year to run, but the developments proving satisfactory, they decided to close the deal at once, to secure full possession and enlarge the operations.

B. F. Pritchard is operating with other parties in the development of copper properties on the lower end of the Bradshaws.——There are 390 stamps in the county of Yavapai, of which the following are known to be in operation: Congress, 40; Santa Maria, 20; Little Jessie, 20; Stanton, Crowned King, Richenbar, Providence, Lottie, McCabe, Sundance, Etta, Heuston & Hull, Ora Bonita, Morning Glory, Pine Mountain, Gladiator, Pickerells, 10 each; on Lynx creek, 40; Pratt, 5; Storm Cloud and Emmett, 2 each.——J. Roberts has an 18-inch ledge on his Ida May mine, in Yavapai county, which goes $30 per ton in gold.——Chicago people have leased several properties near Azurite and have put on a force for development.——Mohave county has three new 10-stamp mills which will crush ore from the Klondyke, Sheep Trail and O. K. mines.——A 3-foot streak of ore has been found in the Erie mine, Cedar district, Mohave county.——The ore from the Nighthawk mine, in Mohave county, owned by McMahan & Davis, runs 1000 ounces in silver and 15 ounces in gold per ton.——J. Uncapner has purchased the property of the Garden Springs M. Co., consisting of the Keystone mine and mill and the Ithica mine.——The Kingman Gold M. Co. has been organized to develop properties near Cedar which are said to have enough ore in sight to justify the erection of a 10-stamp mill.

The Phœnix *Republican* says that the Burro and Telegraph mines, on Burro creek, have been sold to W. H. Day of Denver for $15,000.——The Saginaw M. Co. has purchased the Twin Butte copper mines, near Butte, for $60,000. —— L. Kimmerly is developing a quartz property near Meyers' Well which assays from one-fourth to two ounces gold per ton.——Work at the Golden State Copper Co.'s mines in the Dragoons is progressing.——The Marshall copper property, near Globe, comprising four claims, at a depth of 160 feet has a body of ore that assays 50 per cent copper. A company has been incorporated in New York, known as the Live Oak Copper M. & S. Co., that will begin development work at once.

MEXICO.

Two Republics reports a strike at the San Pablo mine in Pachuca. The ore runs forty ounces of silver to the ton, with a small indication of gold. —— A company headed by F. Horton of Cleburne, Texas, will open placer properties near Pihuamo, Jalisco. They contemplate operating extensively with hydraulic machinery.

Coast Industrial Notes.

—The rolling mill of the Los Angeles, Cal., Iron and Steel Co. has been leased by A. V. Chown and others, with an option of purchase.

—Twenty-seven carloads of oranges were shipped from Redlands, Cal., during the week ending June 2. The total shipments to date are 1334 cars.

—For the ten months ending April 30th the gross earnings of the Oregon Railroad & Navigation Co. showed a gain of $1,636,216; net earnings increased $807,663.

—Work on the Cascade tunnel of the Great Northern Railroad, Wash., is progressing. From the east portal the tunnel is now in 800 feet; from the west portal, 600 feet.

—Mexico has exported $2,000,000 worth of precious metals per month since January 1st. Four-fifths of Mexican exports are to the United States, which supplies Mexico with one-half of all its imports.

—Los Angeles, Cal., has voted to issue $150,000 in bonds for increased fire protection and $23,000 for bridge-building purposes. The bonds will bear 4 per cent interest and run forty years.

—The South Yuba Co. is preparing to put in an additional electric power plant in Placer county, Cal., to act in connection with that near Newcastle, to meet increased demands for power and lights at Sacramento.

—The advancement of the mining industry in Jalisco, Mexico, is ascribed to the unusual influx of modern machinery, for the most part American, and the reopening of buried Spanish mines in various parts of the States, mainly by American capitalists.

—A stock company, said to be backed by London, Berlin, Amsterdam and American capitalists, controlling $25,000,000, has been incorporated under the laws of the State of Washington for the construction and operation of a railroad to extend from a point on one of the northern sounds of Alaska to the interior, a distance of 100 miles.

—Though the frosts damaged a portion of the oranges in southern California, the crop of the season drawing to a close will amount to considerably more than 12,000 carloads. Conservative people, who have given some study to the question, believe that if the crop of next season is not damaged by frost it should amount to 20,000 carloads, or over 100 carloads a day for six months in the year.

—Armstrong, B. C., contemplates waterworks and an electric light system. Money has been raised to complete a survey from the creek, about two and one-half miles from the town, and it is estimated that for the comparatively small sum of $8600 satisfactory systems can be introduced. It is proposed to raise the required money by a twenty-year loan, pledged by the municipality.

—The Southern Pacific R. R. Co. has filed at Oakland, Cal., articles of consolidation, amalgamation and incorporation of the Southern Pacific, the Northern Railway, the Northern California Railway and the California Pacific Railway Companies. The new corporation controls fifty-three lines of railroad, aggregating 4535 miles of rail and is capitalized for $125,455,000. The directors are the same as those of the Southern Pacific Co.

—A cablegram received at Vancouver from London states that a cable is to be constructed from Vancouver to Dawson via Skaguay, Dyea and Wrangel. M. Eschevege at Vancouver represents the Vancouver Anglo-French Telegraph Co., who are to construct the cable under a capitalization of half a million pounds sterling. The cablegram instructed Eschevege to survey the route and clear the right of way at once. The cable is in process of manufacture in England. It is to be a private commercial enterprise, unaided by the Government.

—The receiver of the Seattle Coal and Iron Co., in his report for the three months ending April 30th, shows:

Coal sales	$66,548 89
Rents	256 25
Interest	74 60
Store	1,350 00
Total earnings	$68,229 74
Mining expenses	$38,580 41
Officers, clerks and office expenses	1,773 70
Freights	12,529 95
Retail agency expenses	2,225 75
Royalties	1,144 68
Taxes	215 23
Insurance	137 87
Total expenditures	$56,597 59
Assets	$66,031 95
Liabilities	34,134 24

—From the Canadian government comes a new order by which Canadian goods carried in American vessels from Canadian ports to Alaskan ports, and there transhipped to ports in the Northwest Territory, will be admitted free of duty. American goods upon which duty has been paid to Canada, carried subsequently by American vessels from Canadian ports in Alaska, and there transhipped to places in the Northwest Territory, will also be admitted free of duty. The section that applies directly to us is as follows: "Goods purchased in Canada, duty paid or free, and goods or produce of Canada which are carried to Alaska free of United States custom duty, may be admitted into the Northwest Territory free of Canadian custom duties, when shipped from ports in Canada, under regulations prescribed by the Minister of Customs, provided that the identity of the goods shall be established to the satifaction of the collector of customs at port of entry."

—The San Diego, Cal., *Union* says that Pittsburg men have undertaken the development of the sulphur deposits in Lower California, near the head of the gulf, and will build a railroad from Yuma to San Diego, with a branch connecting with the sulphur mines. The syndicate, so far as its operations in Lower California is concerned, is known as known as the Mexican Sulphur M. Co. The Mgr. is J. A. Dubbs of Ventura. The mines are twenty miles above the mouth of the Rio Colorado, near the Hardy. These deposits are a series of low hills or part of an extinct crater. The sulphur is found in masses having a higher percentage than any body known. The deposits are on the flat desert, in one of the hottest portions of the earth's surface.

—The victory at Manila compels occupation of the Philippines for an indefinite period, and will result in the trade between the United States and the Islands being carried on by means of American ships. All our commerce with the Philippines now goes in British ships and balances are settled through London. With the Islands in possession of and governed by the United States, it will have to go in American vessels and the exchange will be direct. "This," says the New York *Commercial Advertiser*, "is what we have been struggling for for years. We have been struggling to sustain a languid merchant marine on the Pacific coast with subsidies." When, as is coming with swift strides, Pacific shipping shall have a monopoly of the trade between this country and 10,000,000 people, with a commercial capital of 300,000, it will grow like a mushroom over night. Steamship lines to Manila will appear by magic, and tramp steamers and sailing ships will keep down rates by competition. In a few years we shall have an ocean-carrying trade with the East rivaling the China trade of fifty years ago, and direct exchange with Manila will give us banking as well as freight and insurance profits. But nobody supposes that American steamship lines to Manila would stop there, only 600 miles from Hongkong, 1500 from Yokohama, India and Australia, and in the very thick of the East Indian islands. From this central station we should reach out for trade in every direction. Our own ships, instead of British, would carry wheat, cotton, petroleum and manufactures to Japan and China, India and the Islands, and bring back tea and fabrics, hemp and jute, rice and coffee from Ceylon and coal from Australia. With the tremendous advantage of the Philippine and Hawaiian monopoly, we should soon take the lion's share of the trade between the United States and Asia—a trade of which the present sees only the paltry beginning.

—Director of the Mint Roberts is at Seattle, Wash., arranging for the assay office to be established there. He says: "The Seattle assay office will receive deposits of gold precisely on the same terms as govern the reception of gold at the United States mint. All bullion is shipped to a mint at the expense of the Government, while the Government does not share any of the expenses incurred in the transportation of gold to an assay office. Under the terms of deposit which will govern the Seattle assay office, and are now in vogue at the other assay offices of the country, the miner will deposit his gold and it will be weighed in his presence, after which he will be given a receipt. The gold will then be taken to the smelting room and treated for the purpose of eliminating the foreign substance. After the foreign substance is eliminated the gold is then cast into a bar of rectangular form, and two assayers are put to work on it. One of the assayers takes a clip of gold from one end and assayer No. 2 performs a similar operation on the other end. If the assays agree or conform with each other, the bar of gold is presumed to be of the same fineness all the way through. If the assays disagree, the bar is again sent to the smelting room for treatment, and the same operation is gone through until such time as the two assays agree. The miner is paid substantially the amount that his gold reresents in coin, there being only a few slight charges for the treatment of coarse gold. It can be said, though, that the miner is paid substantially what his gold represents in money. Payment at the assay office will be made in drafts on the United States government, which are usually worth par at any bank, while at the mint the depositor has the privilege of being paid in coin made out of his own coin if he desires. The system which governs the operations of a mint would not be practicable at any assay office, as money is not coined at an assay office. The assay office in Seattle will be in operation by July 10: The other assay offices and their annual receipts are: Denver, the most important in the country, $12,000,000; Charlotte, N. C., and St. Louis, about $250,000 each; Helena, Mont., $2,000,000; Boise City, $1,400,000; Carson City, $650,000. It will be readily seen that the entire force in the office will not be new to the business. The directors of the mints have just recommended the abolishment of the mints at Carson City and New Orleans on the grounds that they do not receive enough bullion, and a mint to cost $500,000 is to be erected at Denver. I believe that three mints—one at Denver, Philadelphia and San Francisco—are adequate to the demands of the country."

Recently Declared Mining Dividends.

Wildman-Mahoney, California, 10 cents per share; payable immediately.

Silver King, Utah, 25 cents per share; June 10.

Morning Star, California, $5 per share; payable immediately.

Swansea, Utah, 5 cents per share, $5000; June 10.

Pennsylvania, 5 cents per share, $2575; payable immediately.

War Eagle, B. C., 1½ cents per share, $30,000; payable immediately.

Victor, Colorado, 50 cents per share, $100,000; June 3.

Calumet & Hecla M. Co., Mich., $10 per share; payable June 30—a total to date of $53,850,000.

Osceola C. M. Co., Mich., $1 per share; June 10.

Personal.

W. CHYNOWETH is now Supt. McCarthy mine, Keswick, Cal.

T. T. LANE continues in charge of the Lane mines, Ely, Nevada.

W. J. HARRIS is appointed Gen. Mgr. B. C. F. Co., Rossland, B. C.

A. J. LAUTERMAN becomes Gen. Mgr. Iron Crown mine, Lewiston, Idaho.

E. L. MONTGOMERY has been appointed Supt. Utica mine, Angels, Cal.

H. N. NELSON has been appointed Supt. Jordan mine, Mono Lake, Cal.

D. FRICOT, owner Independence mine, Grass Valley, Cal., is in San Francisco.

JNO. OWEN is the new manager of the Sun & Moon M. Co., Idaho Springs, Colo.

L. L. MEYERS, Supt. Malakoff mine, North Bloomfield, Cal., has returned home.

ROSS E. BROWNE, accompanied by R. McKenzie and Karl Hoffman, is examining the German mine, near Washington, Cal.

D. C. STAPLETON who recently examined mining properties in northern California and southern Oregon, has gone to London.

SECRETARY OF THE INTERIOR BLISS expects to be present at the International Mining Congress at Salt Lake, Utah, next month.

PROF. JAS. S. KEELER, recently of Allegheny, Penn., assumed the position of director of the Lick, Cal., Observatory this week.

IRVING M. SCOTT, of the Union Iron Works, left New York City for St. Petersburg, Russia, on the 7th inst. He expects to be absent three months.

W. R. CHADBOURNE, Gen. Mgr. Mikado mine, Leadville, Colo., is examining the Lindsay mine, Maybert, Cal., with a view to bonding it for his company.

R. A. F. PENROSE, Pres. Commonwealth, Arizona, G. M. Co., who recently bought the Juniper mine, Cochise Co., Arizona, for $75,000, is examining mining property at San Bernardino, Cal.

CURTIS H. LINDLEY has returned from Washington, D. C., where, before the U. S. Supreme Court, he brought to a successful issue two mining cases fully reported and illustrated on pages 613, 614 and 615.

DIRECTOR OF THE U. S. MINT ROBERTS is visiting this coast. He says: "I predict that the entire gold output of the country during the present year, inclusive of Alaska, will reach $100,000,000. South Africa is running us a very close race. In 1897 the output of that country was only $2,000,000 behind the United States, and I have been advised that during the first part of 1898 the Rand district was running 50 per cent ahead of last year. The present gold production of the world is far ahead of both the gold and silver production a few years ago. In 1873 the gold and silver production of the world was about $180,000,000, while the production of gold alone is now $300,000,000."

IN addition to the delegates to the Mining Congress at Salt Lake City, Utah, next month already selected by the California State Mining Association and other bodies, Gov. Budd, last Wednesday, appointed the following delegates. H. W. Duncan, U. S. G. Todd, C. C. Wright, Los Angeles; M. F. Tarpey, Alameda; W. F. Prisk, Grass Valley; T. T. Lane, Angel's Camp; James McMurry, Weaverville; Dr. Frank Bosqui, Bodie; D. C. Reid, Redding; J. H. Neff, Colfax; J. F. Parks, Jackson; T. R. Bard, Hueneme; E. C. Chapman, Taylor mine; Mrs. C. H. Church, Princess mine, Coutolene, Butte county; J. M. Gleaves, U. S. Surveryor-General; Louis Glass, S. K. Thornton, A. B. Paul, J. D. Siebe, J. E. Doolittle, J. V. Coleman, San Francisco; James O'Brien, Smartsville; J. E. Sexton, Placerville; F. R. Wehe, Downieville; J. Ross Jr., Sutter Creek; E. M. Preston, Nevada City; F. F. Thomas, Gwin mine, Calaveras Co., W. F. Detert, Jackson.

Commercial Paragraphs.

C. B. BOOTHE & Co. of Los Angeles, Cal., have furnished the Consolidated Water Co. of Pomona, Cal., with the largest pneumatic lifting pumping plant ever erected in southern California.

AN air compressing plant recently installed at the Alaska-Treadwell mine, Douglass island, Alaska, includes what is said to be the largest Pelton water wheel in the world. In this installation a duplex-Riedler compressor with 24-inch cylinder is driven by a horizontal, cross-compound condensing engine, with 24-inch and 36-inch cylinders and 36-inch stroke. The steam cylinders are placed behind the air cylinders, and the piston rods are provided with couplings. Instead of the usual flywheel, a Pelton water wheel, built by the Pelton Water Wheel Co. of San Francisco, is mounted on the compressor shaft. It is 22 feet in diameter, weighs 25,000 pounds, and will, when running under a head of 480 feet at its normal speed of seventy-five revolutions per minute, develop 500 H. P., delivering 28,000 cubic feet of pure air per minute. The largest water wheel previous to this is operated by the North Star Mining Co., Grass Valley, Cal., and is 18 feet 6 inches in diameter. When from any cause it becomes necessary to shut off the water, the piston rods are connected and the engine is started.

PACIFIC COAST manufacturers are getting deserved and widespread advertising in these days of war and big Government purchases. Recently the official purchasing agent in charge of the Manila expedition, realizing the necessity for ice in the Philippines for the 25,000 soldiers to be sent from San Francisco, inquired of Manager Graham of the Vulcan Iron Works, 505 Mission St., San Francisco, as to the feasibility of his promptly furnishing an ice-making plant. That gentleman immediately demonstrated the ability of the Vulcan Works in that direction, and the order was placed for an ice-making plant with a capacity of 5000 pounds of ice every twenty-four hours. The specifications provide that the ice must be of the best quality and chemically pure—that is to say, made of distilled water, for which purpose a distilling and purifying apparatus is to be provided. With the aid of this latter apparatus pure and wholesome ice is insured, no matter what may be the quality of the water supply. The plant will furnish the ice in blocks 8 by 12 by 36 inches, and weighing about 100 pounds. A steam engine, direct connected, operates the ice machine, and the steam is supplied by a 20 H. P. portable boiler placed on skids. The machine is of the Vulcan vertical duplex cylinder, single acting type, so arranged that either cylinder may be used alone in case of accident to the other. The Vulcan ice machine is in use on the following steamers of the Philippine expedition, viz.: City of Peking, City of Sydney, Colon and Zealandia. The order went naturally to the Vulcan Iron Works, because the Vulcan Iron Works' ice machines have been thoroughly tested in tropical and other climates, and are in use in California, Oregon, Washington, Arizona, New Mexico, British Columbia, Mexico, Central America, South America, Hawaii and many South Pacific islands. These works have developed a large and successful business in the line of ice and refrigerating machinery, covering every size of machine, and are able to give such strong references as the Mountain Copper Co., Keswick, Cal.; Kern County Land Co., Bakersfield, Cal.; Hawaiian Commercial and Sugar Co., San Francisco, Cal.; Gambrinus Brewing Co., Portland, Or.; Hotel del Monte, Monterey, Cal.; and Pacific Mail Steamship Co., San Francisco, Cal. The Government ice plant goes to Manila by swift steamer next week, with three machinists from the Vulcan Iron Works.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 31, 1898.

604,953.—METER DIAL—C. L. Arques, San Jose, Cal.

604,838.—BICYCLE FRAME—J. R. Nagell, Tacoma, Wash.

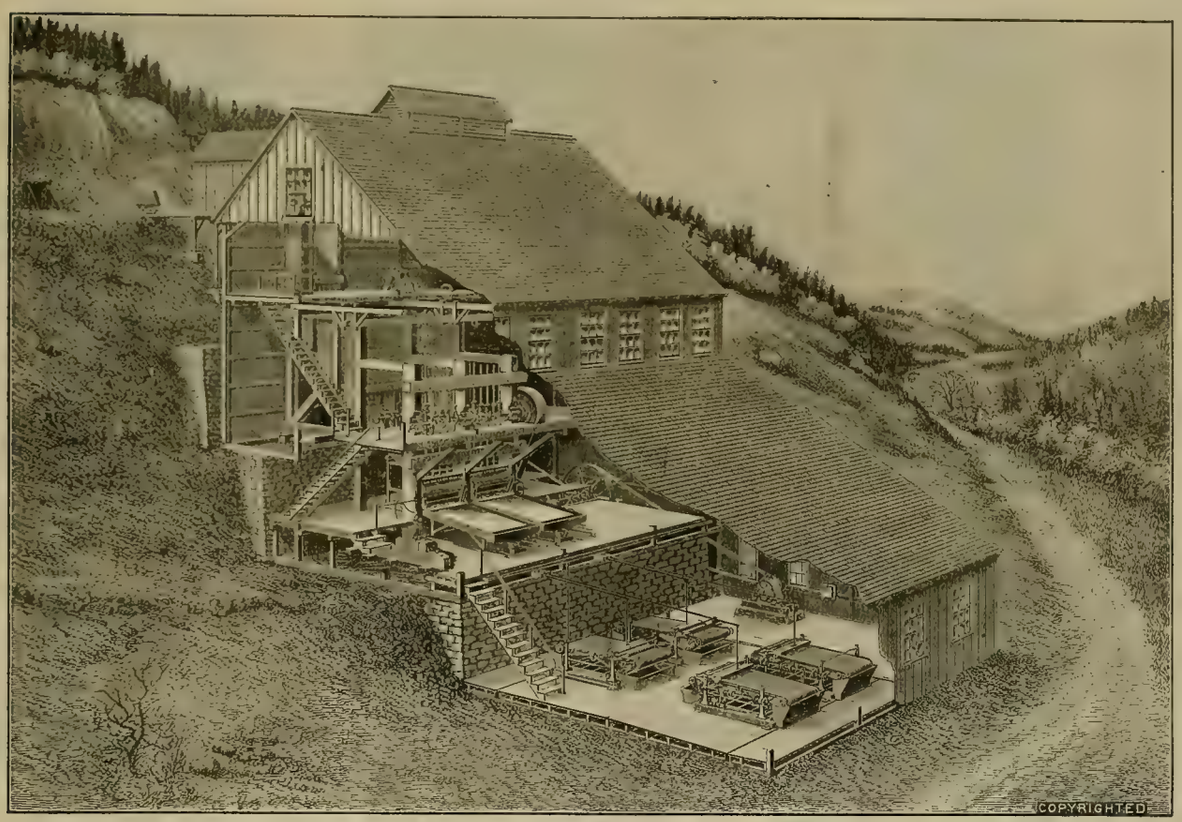
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CYCLE HANDLE-BAR FASTENING ATTACHMENTS.—Edward H. Chappuis. No. 604,876. Dated May 31, 1898. This invention relates to a means for securing the handle bars of bicycles with reference to the handle-bar post, to which they are attached, so that the handle bar may be turned with relation to the post to adjust the ends to varying elevations, and a means for locking this adjustment at any desired point. It consists essentially of a vertically movable handle-bar post, which is slidable in the socket within which it fits. This post is locked at any desired point by means of a cam lever which engages with corrugations, thus enabling the handle bar to be raised or lowered by simply turning the cam lever in one direction to free it and in the opposite direction to lock it as soon as it is adjusted. The handles are usually curved in various ways, and it is often desirable to raise or depress the ends of the handles without raising or depressing the central portion which connects with the post. This is effected by means of corrugating clamping disk faces upon each side of central disks similarly corrugated and fixed to the handle bar. Between the backs of these disks is a wedged-shaped ring which is turnable by means of a cam lever, so as to release the locking disks to allow the handle bar to be turned, and the lever may then be pushed back to clamp the disks with the bar in its new position. This adjustment is easily made, even without stopping or dismounting. The whole is covered with a slide or collar, which keeps it clear from dust.

Recent California Mining Incorporations.



Sheep Ranch G. M. Co., Stockton; capital stock, $600,000; subscribed $700; W. H. Clary, B. F. Langford, G. R. Fletcher, G. F. Volz, C. A. Kern, L. Schumacher, C. L. Feusier.

Desert Queen M. & M. Co., Los Angeles; capital stock $100,000, subscribed $35,000; R. M. McCabe, L. Montgomery, A. G. Refenburg, J. L. Asay, J. R. Chace, W. R. Porter, W. C. Morton.

La Victoria M. Co., San Francisco; capital stock $100,000, subscribed $50; G. Sillesen, J. E. Froid, J. F. Myers, F. A. Hatch, J. G. Chown.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 25 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, June 9, 1898.

Coupled with local activity in supplying the 15,000 soldiers camped here is a general expectancy in all industrial lines "after the war is over," which event is of indefinite date. Money is easy. During the week over $500,000 advance of the proposed 3% Govt. loan was subscribed for. There are just expectations of increased Pacific coast trade in the probable event of retention of the Philippines by the U. S. Government.

The principal trade event of the week is the action regarding freight rates. On the 25th inst. a new transcontinental freight rate goes into effect, of interest to the coast. There is a general advance. Per 100 lbs., Babbitt metal is advanced from $1 to $1.50 in less than carloads and from 80 cents to $1, carloads, from all points. Brass goods, including butts, bolts, castings, faucets, hinges, nails, rivets, tacks, blanks, screws, door rails, brass ingots, pipe, tubes, flues, plate and shunt brass, rods, valves and fittings, show an advance of from 40 to 50 cents per 100 lbs. on less than carload lots, and from 10 to 15 cents per 100 lbs. in carload lots. Copper goods, including bar, ingot, cast plate, bolts, nails, pipe, tubes, rods, plate and sheet copper, etc., are advanced from $1, less than carloads, to $1.40 and $1.50, and from 80 cents, carloads, to 90 cents and $1.

Hardware, less than carloads, advanced from $1 and $1.20 to $1.50, $1.75, $2.20 and $2.60. Iron and steel (articles of), less than carloads, advanced from $1 to $1.10, $1.25 and $1.50. Machinery, set up, advanced from $3.60 to $4.50, less than carloads. Same, knocked down, in pieces, advanced from $2.40 to $3. Same, completely knocked down and boxed, advanced from $2.15 to $2.60.

Nails and spikes, less than carloads, advanced from $1 to $1.25@1.35.

Powder, gun and black blasting powder, carloads, advanced from $1.70 to $2.

New York quotes: Lake copper quiet, $11.90 bid, $12.10 asked. Tin firmer, $15 bid, $15.10 asked. Spelter unchanged, $4.35 bid, $4.45 asked. Lead steady, $3.72 bid, $3.77 asked. An advance in lead is naturally looked for. The same market quotes silver 59⅛, London 27⅛, San Francisco 59¼.

In metals local quotations are Tinplate, $3.50; English, to arrive, $4.25; Pig Tin, 16c ℔ lb; Yellow Metal, 13@13½; Lead Pipe, 5½ @6; Sheet Lead, 6.2@7c ℔ lb.; Pig Iron, American Soft, $20.00@22.00; Scotch, $20.00@ 23.00 ℔ ton.

Yard prices on Coast Coal, to dealers, are: Wellington, $8.00; Seattle, $6.00; Coos Bay, $5.00; Southfield, $7.50.

Last week's quicksilver quotations are unchanged; an advance is considered probable. In chemicals, large lots, current quotations are: Bi-carb. Soda, English, $2.40@2.50; Hyposulphite of Soda, $2.50@2.60; pure Caustic Potash, $8@11; Saltpetre, refined, $6.75@7.00; Nevada Soda, $1.50@1.90; California Bi-Carb. Soda, $2.40@2.50; California Muriatic Acid, $3.50@4.00; California Sulphuric Acid, $2.25@ 4.00; Sulphur, Cal., sublimed, $2.50; Copperas, 80@85c; Sulphate of Zinc, $6; Cyanide, 30@ 32c; Borax, 5@6c ℔ lb.

Mining Share Market.

SAN FRANCISCO, June 9, 1898.

The summer lull and a war diversion was marked this week solely by a little rise in Sierra Nevada, selling up to 75, Caledonia also showing a little life. To illustrate the present slender volume of business it is only necessary to cite this morning's session of the San Francisco Board, when 260 shares of stock were sold—a shadow of former business.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

SANTA FE ROUTE

The Most Comfortable Way to Travel

ACROSS THE CONTINENT.

EVERY day in the year Pullman Palace Sleeping Cars and Pullman Tourist Sleeping Cars leave Oakland Mole for Chicago and the East.

HARVEY'S DINING ROOMS

And Lunch Counters Offer Good Food Well Cooked and Decently Served at REASONABLE PRICES.

THE altitude of the plateaus and mountains crossed renders the trip cool and pleasant after the desert is passed. No matter which way you go the desert must be crossed and there is less of it on the Santa Fe than on other lines. It is a popular mistake to suppose it is a hot line. Close connections are made in Chicago and Kansas City for all Eastern cities.

THE OREGON SHORT LINE RAILROAD.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

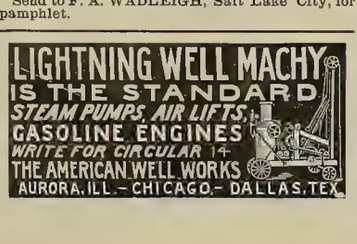
La Sal Mountains.



NEW, RICH MINING DISTRICT.

Best reached by way of the
Rio Grande Western Railway
from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfits can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.

The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.

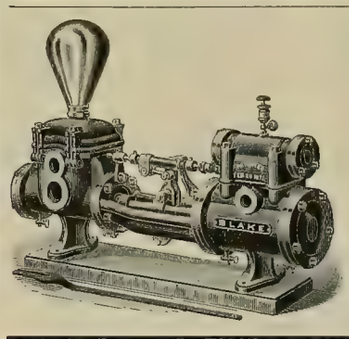
MARSH STEAM PUMPS.



SINKING AND STATION PUMPS
For Mines.
BOILER FEEDERS,
Deep Well, Tank and Vacuum Pumps.

The MARSH SINKING PUMPS are Superior in the Following Points:

First—Compactness.
Second—Strength of parts.
Third—Fast speed, quiet action.
Fourth—No throttle valve necessary in exhaust pipe.
Fifth—Steam valve self-governing; will not race or pound if water gives out with steam valve wide open.
Sixth—All moving parts can be covered and protected from falling dirt.
Seventh—No packed joint between chamber and pump to give out and need renewing.
Eighth—Exhaust can be turned into suction.
Ninth—All parts easily accessible and fewer than in any other pump.

LUNKENHEIMER'S

Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class now upon the market. The body is heavy and well proportioned, the seat is carefully finished and the general workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

Particular attention is called to the quality of metal used, it being the best gun metal composition.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

The regular pattern of this valve is guaranteed to stand a working pressure of 175 lbs., but we also make a line of extra heavy valves of this kind to stand pressures up to 350 lbs. All valves are carefully tested and warranted.

Specify "Lunkenheimer" make.

Sold by dealers everywhere.

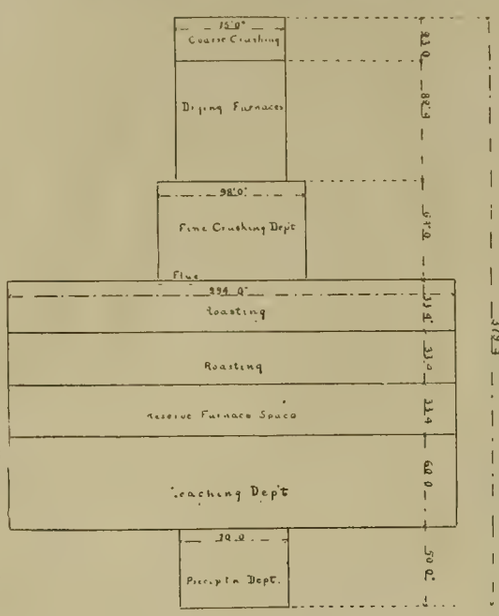
AND PACIFIC ELECTRICAL REVIEW.

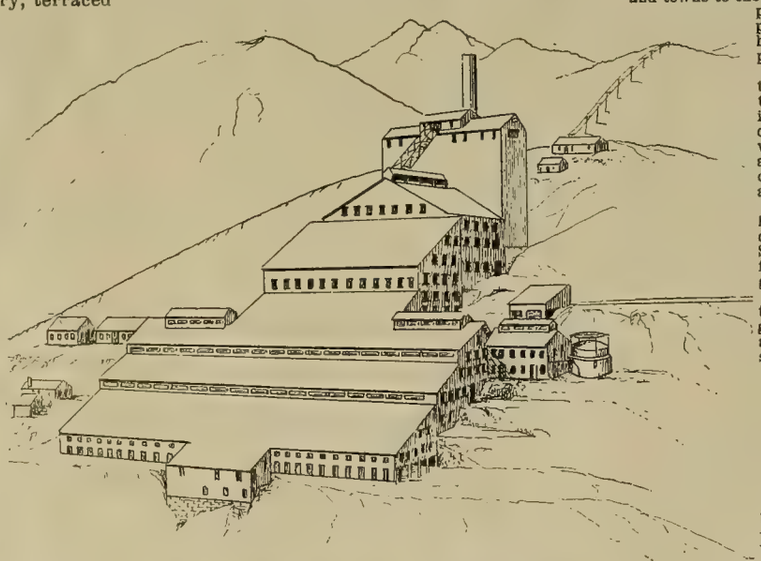
No. 1980.—VOLUME LXXVI. Number 25. SAN FRANCISCO, SATURDAY, JUNE 18, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Big Cyanide Plant.



At Mercur, Utah, has begun operation of what in many ways is the most remarkable cyanide plant on the continent. About $1,500,000 has been expended on mine and machinery. Reference is made to the Golden Gate mill at the mine of the same name, at Mercur, the property of J. R. De Lamar.

Utah is a land of marvels, and has often set at defiance long accepted tenets. The finding of gold in coal, the discovery of silver in sandstone, and the production at Mercur of gold ore in which there is not a trace of silver, are among the singularities. Ordinarily gold bullion contains about 10% silver. A remarkable feature of some Mercur gold ore is the total absence of silver. The district was first a silver producer, free-milling chloride, soon exhausted; then cinnabar was discovered in an overlying vein; lastly gold. Many thousand dollars were lost in abortive attempts at pan amalgamation at the Mercur mine which only secured 15% of the gold, when, in '92, the cyanide process was tried and found successful. At the Mercur, Marion and Geyser mines this process was profitable, with a use of one-half pound of cyanide per ton of ore. Sulphides and arsenical ores in the Golden Gate property and the group by which it is surrounded occasioned experimental work lasting for many months, which has resulted in the building of the biggest institution of the kind in the country.



The site covers an area 300x400 feet; in the foundation is cemented 8000 tons of masonry, terraced till, were it reared perpendicularly, the height would be 300 feet above the earth. The mill building, of steel, is 160 feet from the lowest to the highest floor level, and is 380 feet long by 295 wide. On the top or upper level is a Gates crusher, 25x75 feet. The ore is raised through an incline which starts from the working shaft about 60 feet below the surface, and passing up under a corner of the mill, is automatically dumped into the coarse crushers and run into bins holding 2000 tons. The dryer on second level rests upon solid masonry 40 feet thick, with a floor space 75x82 feet; from this the ore passes to the third level, where are placed the rolls, screens and elevators, and where it is finely crushed and screened, thence going to 25x84-foot ore bins, also of 2000 tons capacity. Under this latter ore bin is a dust chamber 11x100 feet, directly connected with the main flue and provided with eight hoppers.

From the second set of bins the sulphides and arsenical ore discharge into two Brown drying furnaces, reverberatory, hearths 12x60 feet, fired by gas, on the fourth and fifth levels. The silicious ore goes directly from the storage bins without roasting. The sixth level is reserved for additional surface space. On the seventh level is the "leaching department," 298x60 feet, ten solution tanks, each of 200 tons capacity, into which the ore from a tunnel the fifth and sixth levels is discharged. On the eighth level are the precipitation tanks, charged with zinc shavings.

South of the fourth level is a gas-producing plant 30x68 feet. The gas is used for roasting and drying, and, it is claimed, effects a saving of 25% in the fuel bill. Eleven dynamos of a combined capacity of 600 H. P. furnish power. An outline sketch of the mill and of the ground plan furnishes a fair idea of the general appearance.

GROUND PLAN OF GOLDEN GATE MILL, MERCUR, UTAH.

THE GOLDEN GATE MILL, MERCUR, UTAH.

In the mine considerable development work has been done during the last three years, and the men say an enormous amount of $5 ore is blocked out. In mining the cave-in system was adopted—a drift run under the ore body along the footwall, timbered just enough for safety, the ore then divided into blocks, every other block being left standing as a support to the hanging wall, the remaining blocks mined out and the pillars then broken down. To do this a second drift is run along the hanging wall, the ore pillars loosened, gravitating toward the outlet.

Worthy of Commemoration.

On the 1st of next August it will be just twenty-five years since the first cable passenger railway car in the world began operation in San Francisco. It has been suggested that a record of the creation of this great invention be made by erecting a cast steel pillar on the S. E. corner Clay and Kearny Sts., where the terminus of the old Clay street road used to be.

Among those who have made the world better and more advanced for having lived in it is the inventor of the cable railway system—Mr. A. S. Hallidie—and it would be a fitting testimonial to his worth, and appropriate commemoration of a great industrial advance, to erect some such pillar or enduring memorial as suggested. The MINING AND SCIENTIFIC PRESS believes that it would be particularly appropriate for the Mechanics' Institute of San Francisco to take this matter in charge. At a meeting of the Institute, March 3rd, 1891, the following was unanimously adopted:

Your committee appointed to report on the invention of the cable railway beg leave to present the following:

The first street cable railway had its development in San Francisco, State of California, through the skill, ability and energy of one of her citizens, Mr. Andrew S. Hallidie, who completed the construction and had the first road in operation on Clay street in this city on the first day of August, 1873. At the request of the Board of Trustees, Mr. Hallidie placed before the public at the Twenty-fifth Industrial Exposition of the Mechanics' Institute, 1890, the original models and appliances used by him, and also filed a history of the enterprise, which has been embodied in the published report of the exhibition.

The invention and construction of said cable railway has revolutionized the methods of transporting passengers in cities and towns to the great advantage and benefit of the traveling public and the material advancement and prosperity of the towns themselves. Its value has been recognized and utilized in nearly all parts of the world.

The Mechanics' Institute of San Francisco, through its Board of Trustees, does hereby testify to the value and importance of the invention of the street cable railway, and recognizes the genius and worth of Mr. Hallidie, whose patience, perseverance and energy enabled him to overcome the difficulties and discouragements encountered in its construction and introduction; therefore

Resolved, That the Mechanics' Institute hereby records its recognition of the introduction of the cable railway by Mr. Andrew S. Hallidie of San Francisco, State of California, and expresses its appreciation of the great value of said invention.

Resolved, That the foregoing be spread upon the records of the Institute, and that an engrossed copy thereof, signed by its president and recording secretary and sealed with its seal, be forwarded to Mr. Andrew S. Hallidie.

DAVID KERR,
President.
C. F. BASSETT,
Recording Secretary.
A. W. SCOTT,
W. R. ECKART,
J. K. FIRTH,
Committee.

Nothing need be added to the above testimonial. The actual value of Mr. Hallidie's invention to the real estate of this peninsula is enormous. Apart from the improvement, convenience and general advantage of the system of cable railways, the increase in property values consequent th[illegible] est factors in San Francisco's p[illegible] every one whose property has been made more valuable, or whose life has been made easier, by Mr. Hallidie's invention to contribute a cent to the proposed memorial, the aggregate would reach into the thousands of dollars. The idea is commended to the Mechanics' Institute for action thereon. While the air is resounding with acclaim for the heroes of the present war, it is no less in order to appropriately remember and commemorate an equally great achievement in the arts of peace and progress.

The most thorough and Reliab[illegible]

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771

ANNUAL SUBSCRIPTION:

San Francisco, June 18, 1898.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Golden Gate Mill, Mercur, Utah; Ground Plan of Golden Gate Mill, Mercur, Utah, 637. A Double-Header Used on the Mexican Railway, 640. Some Striking Features of the Turlock Irrigation System Just Completed, 641. Duplex Differential Riedler Pump; Dumping Pan Conveyor, 642. Upright Enclosed Engine for Electric Lighting, 644.

EDITORIAL.—A Big Cyanide Plant; Worthy of Commemoration, 637. Quicksilver Production; A Huge Enterprise, 638. A Mineral Land Decision, 639. Miscellaneous, 638-639.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 645-46-47.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 658.

MISCELLANEOUS.—Stamps vs. Rollers, Etc.; Recruiting Volunteers; The Mexican Railway's Double-Header; Large Hoisting Works, 640. A Great Irrigation Enterprise; Water-Tight Wood; Tallest Flag Pole in San Francisco; Some Metallurgical Methods at Broken Hill, Australia, 641. Cyanide Experience in Montana; Dumping Pan Conveyor; Duplex Differential Riedler Pump; Harnessing the Sun, 642. Coast Industrial Notes; Recently Declared Mining Dividends; Personal; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recent California Mining Incorporations; Catalogues, Etc., 643. Pumping Water into a Tank; Upright Enclosed Engine for Electric Lighting; A Timely Discourse on Disinfectants, 644.

THE MINING AND SCIENTIFIC PRESS is always glad to receive and publish communications of interest in mining and metallurgy. Interchange of opinion and experience is of general value to the mining industry, and mining men everywhere are invited to consider these columns an open forum for discussion and information upon cognate topics.

IN the issue of the 28th ult. it was shown that the mineral yield of California for '97 was $25,142,441, and of Colorado for the same period was $35,964,034. The fact should not be overlooked that the gold, silver, copper and lead yield of Montana for that calendar year aggregated in value $42,308,373, figuring silver at the price of 60 cents per ounce.

AT its recent Salt Lake meeting the Western Federation of Miners declared in committee against the proposition to create a cabinet position of Secretary of Mines and Mining. As the sessions were secret, the reasons or arguments for such action are unknown. It would be interesting to note what their tenor were. If there is any one class more than another that would be benefited by the creation of such a department it is the men who compose the federation. That such a department is a national necessity is a fact patent to many who have given the matter mature consideration.

AS HITHERTO noted, according to the new ruling of the Secretary of the Interior, all applications for U. S. patents for mining claims must be accompanied by an affidavit that $500 worth of work has been expended for each claim. In case of a group of contiguous claims, if it can be shown that the work done on any one of them went to improve or develop the entire group, such will be admissible, provided the affidavit shows that on such one claim the work or improvement aggregates as many times $500 as there are claims in the group for which patent is desired. For instance, if the application be for say five claims, an aggregate of $2500 in work or improvements must be shown to have been expended: such $2500 can have been put entirely upon any one of the five, provided it be shown that such amount tended to improve or develop the whole five. This ruling went into effect last December, but at the earnest solicitation of many mining men was suspended until July 1, 1898. After the 1st of next month there will be no further extension of time, and it is important that this matter be given general heed.

Quicksilver Production.

California is the sole producer of quicksilver in commercial quantities in this country. It is one of the very few American metal products whose price is governed by European production, with the additional anomaly that there is no direct domestic competition, as the product of the Spanish quicksilver mines is sold in Europe and the East, scarcely any Spanish quicksilver being imported to the United States. In the past few months the price has materially advanced, due less to the Spanish war than to the peculiar circumstances of their control. The war makes no increased demand, the tendency, if in any direction, being the other way, yet the price has steadily risen. Following that, of course, manufacturers of quicksilver products have also advanced prices, vermilion, for instance, having appreciated 8 cents per pound this month.

The San Francisco receipts of quicksilver for the first five months of '96 were 15,339 flasks; for the corresponding period of '97, 5960 flasks; '98, 9472 flasks. From San Francisco, during the same period this year, were exported 3261 flasks, of which 2553 went to Mexico, 606 to Central America, 82 to British Columbia, 20 to New Zealand: the value of these shipments was $116,918. There were also Eastern shipments overland, aggregating about 2700 flasks.

In view of the present price and the probability of its continuance, attention is being directed to other possible sources of supply. The Savonas, B. C., cinnabar property has already been described. Southern Oregon correspondents of this paper assert that "immense masses" of cinnabar exist in Douglas Co., and that if treated on a very large scale they could be made valuable. Inquiry elicits the statement that the yield of mercury is less than one-fourth of one per cent, which precludes all possibility of furnace treatment with profit. Where power could be made cheaply available, in connection with concentration, it might be possible to profitably treat very low grade ore; could concentration of ore carrying, say, five pounds of mercury to the ton, be carried to the extent of 10 to 1, a small furnace and reduction plant, economically operated, might be of resultant profit. It is to be said, however, that, so far as we are informed, all efforts to concentrate cinnabar ores have so far been unsatisfactory. This paper would be pleased to receive some authentic data of experiments in this State in crushing and concentrating these ores. It would seem to be largely a question of method, and if in this regard stamp-mill crushing or ordinary sizing and jigging methods were failures in treating this class of ores, other appliances might insure a more satisfactory result.

In intimate connection with the alleged existence of large quantities of low grade cinnabar ores in Oregon and elsewhere, the fact must be bore in mind that, even with comparatively high grade ore and the most modern and economical appliances, the producers of California quicksilver do not find the business extraordinarily lucrative, because of the manipulation of the Spanish mines by their foreign owners.

IN Griqualand, Cape Colony, Africa, are reported discovered large deposits of asbestos, of 25% less specific gravity than the Canadian or Italian product. An English company, composed of owners of the De Beers diamond mines, is organized to mine and market it. Increasing demand for asbestos makes necessary new supplies, though the cost of transportation from the far-off source of the new supply makes profit doubtful. Frequently specimens of serpentine fiber are received at this office from all parts of the coast but so far as observed the deposit is in no instance large enough to be of commercial value.

THE Sonora folio of the Geologic Atlas of the U. S. is this week received from H. W. Turner, U. S. Geological Survey, being the ninth of the California series and of equal importance. The information and the maps printed in colors make this series of value to miners everywhere. The folios may be procured from the U. S. Geological Survey at Washington, D. C., by sending 25 cents for any one of them. This work has received considerable deserved favorable editorial mention herein, and the latest folio is of the same creditable character.

A Huge Enterprise.

What is probably the greatest hydraulic enterprise in the world's history is in progress in Western Australia. The Coolgardie Government has undertaken a tremendous task, to supply the gold mining country of that section with 5,000,000 gallons of water daily. A portion of the enterprise involves the building of a pipe line 328 miles in length; 264 miles of this is to be of riveted steel pipe, about 31 inches internal diameter; 82 miles is to be welded steel pipe, from 26 to 29 inches internal diameter. This matter was given extended technical notice in detail on page 282 of the issue of March 12th, '98, and in this connection is worthy of reference. The engineers composing the committee, in their recommendation, discard cast iron pipe, discussed pipe made of steel spiral embedded in concrete, and as appears by the advertisements have decided upon steel pipe exclusively, which though not so specified, is apparently intended to be laid on the surface of the ground, which, if so, is somewhat surprising. Apart from any consideration of corrosion of the pipe, owing to the alkaline character of the soil, the great difference in the temperature of that country must necessarily occasion great strain. It is calculated that a change of temperature of 50 degrees F., would cause a strain in material between the rivet holes in circumferential seams of riveted pipe equal to about 16,000 pounds per square inch. The fact that the temperature in Coolgardie at times reaches 130 degrees F., indicates this to be a serious factor in the problem. At the time the matter was first broached it was suggested herein that California redwood could well be used. Californian and American engineers generally have had considerable experience in this regard, some extensive pipe lines having been built in portions of this west half of America, where the conditions, climatic and otherwise, strongly resemble the country under discussion. The proposed contract is a very extensive one. The 328 miles of pipe called for in the advertisement will weigh in the neighborhood of 85,000 tons, to be delivered in Western Australia. This alone involves an expenditure of about $4,000,000. It will be noticed that the "Government does not bind itself to accept the lowest or any tender." From an American standpoint there are some curious conditions attached. Anyone desirous to bid will have to pay "two guineas" for form of tender. The bids must be in the office of the London agent, 15 Victoria, Westminister, S. W., or in the hands of the director of public works, Perth, Western Australia, by noon of August 23rd, 1898. The office of the American agents, Messrs. Seward, Guthrie and Steel, is at 40 Wall street, New York, whom any American contractor desirous of considering the work would do well to address. From the form of the advertisement it would appear that this entire matter is somewhat preliminary, and based upon a desire for information on the part of the projectors. The report of the committee would indicate that further information received by the Western Australian Government would be a matter of considerable economy to them.

A CURRENT item in a Denver, Colo., daily furnishes emphatic comment upon different forms of mine management. It seems that the owners of the Lucky Guss mine, after paying $140,000 for the property, worked it for two years at a loss, and four months ago owed seventeen working miners $5200. The mine was turned over to them to get out, if they could, enough to pay what was due them. The miners knew what could be done under practical, competent management, took the property, paid all mining expenses, and so managed that the royalties on the ore shipped during the time they had charge amount to something more than the sum the company owed them when they took hold. Having been shown how to make their property pay, the owners now propose to resume control of their property and work it themselves. The seventeen miners want to lease the property, and, unless the company has a good manager in view, it would seem more profitable to them to continue the present arrangement. Of course, in the absence of detailed facts, it is possible that were all the circumstances given, the onus of failure should be placed somewhere else than on the shoulders of the former manager, but the incident as

published strikingly illustrates the difference between success and failure resulting from two different methods of mine management.

A Mineral Land Decision.

In the issue of Jan. 22nd, '98, was an editorial paragraph on a decision in a case in the Circuit Court for the northern district of California. The Government had brought suit against the Central Pacific Railroad and sundry Butte county residents to secure a reversion of a section of mineral land in that county. In 1866 the public land commissioner granted the land to the railroad company as agricultural land. The company subsequently sold it to the Butte county men, who were made general defendants in the suit, and who developed large mining interests thereon. The Government, through its lawyers, asked that the patent be cancelled by reason of error on the part of the land commissioner, as the land was evidently mineral and not subject to the terms of the original grant. It was further held that the defendants were acquainted with this fact and that they also owned mines in the immediate vicinity of the lands under dispute. The counsel for the Government maintained that this error of the land commissioner could be corrected and that the original patent to the railroad company could be cancelled, which was the view held by Judge Morrow in deciding the case. Following is the syllabus and decision in full, as furnished by A. H. Ricketts, chairman of the Mineral Land Committee of the California State Miners' Association:

UNITED STATES v. CENTRAL PAC. R. CO. et al.

1. PUBLIC LANDS—MINERAL GRANTS.

A patent granted under Act July 25, 1866 (14 Stat. 239), which excepted mineral lands, is invalid, if at the time of the issue of the patent the land was known to be chiefly valuable for mineral.

2. SAME—CANCELLATION OF PATENT.

Under Act March 3, 1887 (24 Stat. 556), authorizing suits to cancel patents to lands erroneously certified or patented, and to restore the title thereof to the United States, a patent conveying mineral lands knowingly purchased as agricultural lands will be cancelled as having been erroneously made.

3. BONA FIDE PURCHASERS—NOTICE—GOOD FAITH.

Purchasers of land erroneously patented as agricultural land are not bona fide purchasers without notice, when they knew at the time they purchased the same that it was mineral land; and purchasers who located and worked mineral claims thereon prior to acquiring any interest therein are not purchasers in good faith.

This was a bill by the United States against the Central Pacific Railroad Company, James O. B. Gunn, William E. Brown, W. M. Bowers, John Gale, A. F. Jones, Henry A. Basford and Milton E. Joyce, to cancel a patent issued to the Central Pacific Railroad Company under a land grant.

W. H. H. Miller, U. S. Atty. Gen. (H. S. Foote, U. S. Atty., and Samuel Knight of counsel), for the United States.

Mastick, Belcher & Mastick for defendants.

MORROW, Circuit Judge. This is a bill in equity brought by the United States to cancel and set aside a patent to public lands issued to the Central Pacific Railroad Company, successor to the California & Oregon Railroad Company, under the act of July 25, 1866 (14 Stat. 239). The bill, as amended, alleges that the patent was made to include section 27 in township 24 N., range 3 E., Mt. Diablo base and meridian, through mistake and inadvertence on the part of the officers of the Land Department. This section of land is situate in Butte county, State and northern district of California; and it is alleged in the bill, as amended, that for a long number of years before the selection of said section 27, and prior to the issuance and delivery of said patent, said section was, and it since has been, and it is now, well-known mineral land, and that it was at all of said times, and it is now, valuable chiefly for its mineral, and that during all of said times it was, and it is now, not valuable for agricultural or timber purposes, and that during all of said times it was, and it has been, and it is now, worked successfully as mining ground, and that at all of said times there were, and there are now, in successful operation, a number of mines on said land. The defendants answered the bill as amended. The United States introduced testimony in support of the allegations as to the mineral character of the land. No evidence was presented on behalf of the defendants, beyond their sworn answers.

That a bill in equity will lie to correct material mistakes of the Land Department in granting patents to public lands is beyond question. McLaughlin v. U. S., 107 U. S. 526, 2 Sup. Ct. 802; U. S. v. Minor, 114 U. S. 233, 5 Sup. Ct. 836; Mullan v. U. S., 118 U. S. 271, 6 Sup. Ct. 1041; Williams v. U. S., 138 U. S. 514, 11 Sup. Ct. 457. Mineral lands were excepted from the grant made by the United States to the railroad company. See Act July 25, 1866, §§ 2, 4, 10 (14 Stat. 239). The question to be determined by the court is whether the land involved in this controversy was or was not "known mineral land" prior to the issuance and delivery of the patent therefor. The map of definite location of the California & Oregon Railroad opposite the land in question was filed November 25, 1867, and the land was thereupon withdrawn from sale. The patent was issued March 17, 1875. The testimony shows that section 27 contains mineral lands; that the land is unfit for agricultural purposes, but is valuable chiefly for its mineral; that it was "known mineral land" at and prior to the issuance of the patent; that it was occupied by miners at very early days. Some of the witnesses state that they went on the section as early as 1850 and 1851, and that they mined there at, or shortly after, that time; that mining was carried on subsequent thereto; and that it has been remunerative. It would be useless to review the testimony in detail. It is sufficient to say that it shows clearly and satisfactorily that section 27 contains, and contained "known mineral land" when it was withdrawn from sale, and when the patent was issued. The evidence certainly satisfies the test of what are mineral lands, according to such cases as Deffeback v. Hawke, 115 U. S. 392, 404, 6 Sup. Ct. 95; Davis' Adm'r v. Weibbold, 139 U. S. 507, 519, 11 Sup. Ct. 628; Iron Silver Min. Co. v. Mike & Starr Gold & Silver Min. Co. 143 U. S. 394, 12 Sup. Ct. 543. See, also, for definition clearly stating what constitutes mineral lands, the language of Judge Knowles in Railroad Co. v. Barden, 46 Fed. 610; Id., 154 U. S. 288, 14 Sup. Ct. 1030. The general criterion would seem to be that the land must be more valuable for mineral explorations than for agricultural purposes. There must be sufficient evidence of mineral to justify the expenditure of time and money for its extraction. And it must be so known at the time of the issuance of the patent therefor. Deffeback v. Hawke, supra; Davis' Adm'r v. Weibbold, supra; Whitney v. Taylor, 158 U. S. 85, 15 Sup. Ct. 796; Barden v. Railroad Co., supra. All these conditions appear to be amply satisfied by the evidence presented. It follows that the patent to the railroad company, in so far as it includes section 27, was issued through mistake and inadvertence on the part of the officers of the Land Department, and that it is void for want of authority to issue the same. Section 2318 of the Revised Statutes of the United States provides "that in all cases lands valuable for minerals shall be reserved from sale, except as otherwise expressly directed by law." It being established that the lands in section 27 were valuable chiefly for mineral at the time of the issuance of the patent, the title of the grantee company could not be held valid, because acquired contrary to law. Stoddard v. Chambers, 2 How. 284. If the lands are valuable for mineral, and were knowingly purchased as agricultural lands, the patent issued by the Government would convey no title, because issued unadvisedly, or by mistake of an officer of the Government while acting ministerially. U. S. v. Stone, 2 Wall. 525. The mistake and inadvertence on the part of the officers of the Land Department are easily explained. The application by the railroad company for the land under the Act of July 25, 1866 (14 Stat. 239), was entirely ex parte. The railroad company applied for the land, as being within its grant, and the officers of the Land Department considered that the land was subject to the application. But this cannot prejudice the rights of the United States, if the lands were in fact mineral, and were known to be such when the patent was issued. There was no protest or contest of any kind which was likely to bring to the notice of the officers of the Government the fact of the mineral character of the land. The patent having been made to include, erroneously, this section of land, to the railroad company, the United States has a paramount right to have the error or mistake corrected. The Act of March 3, 1887 (24 Stat. 556), authorizes suits to cancel patents, or other evidences of title to lands "erroneously certified or patented," and "to restore the title thereof to the United States." This disposes of the case, so far as the grantee company and its trustees are concerned.

With respect to the other defendants, it is further urged that they are bona fide purchasers. It appears from the allegations of the amended bill that these defendants hold contracts with the grantee company and its trustees to purchase from the latter the legal title to certain parts of section 27. The status of a bona fide purchaser is made up of three essential elements: (1) A valuable consideration; (2) absence of notice; and (3) the presence of good faith. 2 Pom. Eq. Jur. § 745; U. S. v. Winona & St. P. R. Co., 15 C. C. A. 96, 67 Fed. 948, 962. I am of the opinion that these defendants had notice, actual or constructive, of the character of the land in section 27 which they contracted to buy from the grantee company and its trustees. They were certainly chargeable with notice of the character of the land, for it had been occupied and known since 1850 as mineral land, and as being unfit for agricultural purposes. It was covered with evidences of mining claims and mining explorations. Notices of location affecting different portions of the section had been filed of record in the mining recorder's office of the Forks of the Butte mining district before the defendants entered into their contract to buy the land from the grantee company and its trustees, which was some time in 1885 and 1886. With respect to the defendants Jones and Gale, it appears further that the element of good faith is entirely wanting, for Jones had, before acquiring any interest in the land he contracted to purchase, owned and worked a claim in the same part of this section, while Gale had, with others, filed a mining location upon the same land which he contracted to buy.

Without entering into a further discussion of the points involved in this case, I am of the opinion, from the evidence, (1) that section 27, township 24 N., range 3 E., Mt. Diablo base and meridian, State of California, contains lands which are valuable chiefly for mineral explorations, and not for agricultural purposes; that this fact was known at and prior to the time when the patent was issued to the grantee company; (2) that the patent, in so far as section 27 is concerned, was issued through mistake and inadvertence on the part of the officers of the Land Department, and that it is void for want of authority in said officers to issue the same; (3) that the defendants, other than the grantee company and its trustees, are not bona fide purchasers. A decree will therefore be entered in favor of the complainant—the United States—declaring the patent void with respect to section 27, and directing a cancellation of the same; and it is so ordered.

THE Risdon Iron Works of San Francisco is pioneering a new manner of placer mining in Colorado—dredging the streams. At Breckenridge in Summit county, where the depth to bedrock is 40 feet, and the fall is too slight to make ordinary placer work profitable, two dredgers have recently been put in, and local reports are favorable. In New Zealand costly experiments have reduced river gold dredging to almost an exact science: in California great progress has been made in that direction in the past few years: in Montana the method has met with marked success, and, now for the first time in its history, the great commonwealth that has laid down the garb of the silver miner to win pre-eminence in the product of gold, essays a new form of placer gold mining. The Blue River valley is a good field for such initial operations.

THE hitch in the sale of the Le Roi, B. C., mine, the biggest mining transaction of the year, seems to be a purely technical one occasioned by the mining laws of the Province. In '97 the British Columbia Legislature repealed the former law on the subject and enacted one which does not include registered foreign corporations. It was assumed that a two-thirds vote of the stock could convey the property, but it is now claimed by British Columbia authorities that while control could thus be secured, full title to the property can only be had by buying every share of the stock. The question is simply this: Can a foreign corporation sell by vote of a majority of the stock? This right is conceded to corporations where there is no contrary provision and such general right will, doubtless, ultimately prevail in this case.

OBJECTORS to mining investments sometimes plead the "transitory character" of a mine. The objection is not well taken, for, if extended, would apply to every form of business. Indeed, few forms of investment are more permanent. How often one notes the going to pieces of some old-established mercantile business or the sudden cessation of what seemed a profitable enterprise in every line of business! Yet that is not used as an argument against embarking in trade or engaging in any line of business. In this regard the mining business will not suffer by comparison. It has of late years become similar to any other form of legitimate enterprise—has its successes and failures—just as has any other line of human effort.

OUR agents traveling through the mining regions write that everywhere they find the prospector. This is the season when in many places the prospector is most active. Usually he prefers a lively mining camp, as a claim can be disposed of in that vicinity quicker than in a quieter or less talked-of locality. Next in point of attractiveness is a section where long paying mines are in operation, and have thus made the surroundings of good repute. The investor who prefers to pay a small price for a good prospect, out of which a dividend-paying mine can be made, in preference to paying a big price for an already producing mine, usually makes, in the long run, a more profitable investment.

Stamps vs. Rollers, Etc.

In the current number of Mines and Minerals, a prize of $1, offered for the best answer to the following question, was awarded to H. Vernon of Oakland, Cal.:

Say whether you would prefer a roller quartz mill or a battery of stamps for crushing gold-bearing quartz, and explain its relative merits and the special conditions under which you would prefer one or the other:

The relative merits of roller and stamp mills are dependent upon the conditions under which the mills are to work. The advantages of roller mills are the following: The cheapness and ease with which the mill is transported and erected as compared with stamps; they are better adapted for crushing clayey, oxidized or soft ores that require a moderate degree of crushing in order to liberate the gold; also for ores in which the gold is coated with a film of oxide (commonly called rusty); the roller mill is very efficient in scouring the gold so as to present a bright surface for amalgamation; the roller mill is also to be preferred to a stamp mill for recrushing middlings or jig tailings, or where the output is small, or the crushing is intermittent. Roller mills save a good percentage of the gold, under favorable conditions saving as high as 80 per cent within the mortar, which is higher than is generally recovered on the inside plates in a stamp mill. The roller mill is very useful as an auxiliary crusher to the stamp mill for crushing the fine material that may occur with the ore, and thus permit the stamp mill to be regulated for crushing an ore of uniform size and hardness. However, this is not always advisable, as the quantity and value of the fine stuff, the probability of the character of the ore changing, etc., are factors to be considered. Greater efficiency, though, is secured in adapting a mill to the ore, rather than the reverse.

The disadvantages of roller mills as compared with stamp mills are as follows: They are not economical when crushing hard quartz ores owing to the excessive wear of the rollers, which have a tendency to wear unevenly on the surface, necessitating frequent changes, thus diminishing the capacity; the frequent stoppage of the mill for inspection and cleanup, and its unsuitableness to ores of a varying nature.

The advantages of stamp mills over roller mills are as follows: Increased capacity, freedom from stoppages and repairs; the wearing parts being simple castings are readily duplicated in any ordinary foundry; especially adapted to hard quartz ores and those of variable character without changing the construction of the mill; they also possess the advantage of stopping one or more stamps at will without interrupting the others. In short, the stamp mill is to be preferred for crushing gold-bearing quartz because it has proven itself a reliable and economical crusher under various conditions; it is easily started and stopped; is an efficient amalgamator, and is the mill most generally used and adopted for extracting the gold from most free-milling ores.

The disadvantages are the firm and substantial foundation required; the expense in transporting the mill through rough country and its unsuitableness for treating clayey ores that require a scouring action in order to release the gold.

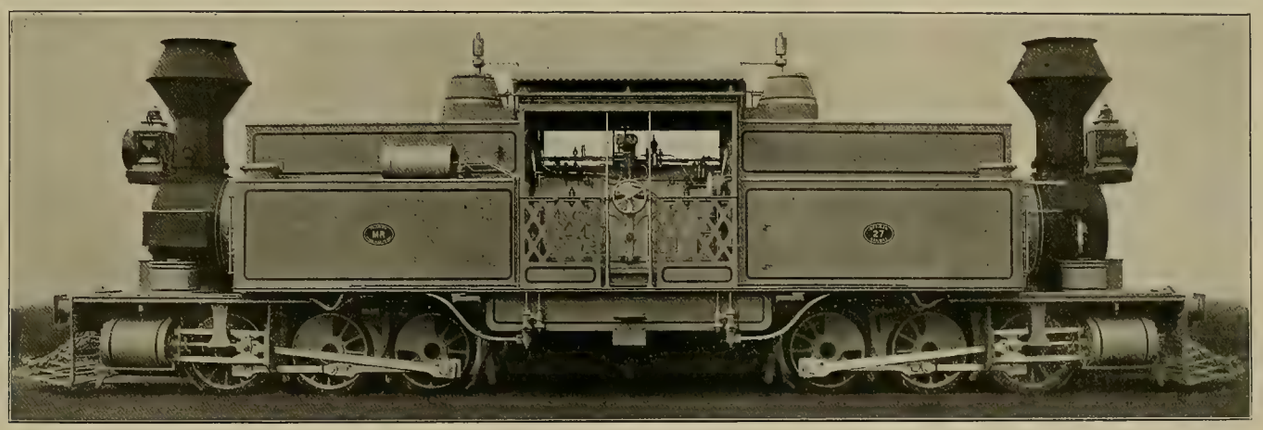
W. J. Weatherby of Cooney, N. M., answers another question thus:

If you had a sample of argentiferous ore given to you, what would you do with it to determine its value?

Although an argentiferous example is designated, we shall test for gold as well, since the latter may be present in any unfamiliar silver ore. The larger particles of ore are first examined with a lense to determine the probable value (whether exceedingly rich or not) and the general character, in order to select the best method of treatment. Let us suppose such examination showed it to be a medium grade ore of such character that we decide to find its value by fire assay, crucible method. The operation of crushing and parting the sample is carried on until only about six ounces remain, all of which must be passed through a 100-mesh screen. One assay ton of the pulp is carefully weighed out and transferred to a fireclay crucible containing the proper amounts of soda, litharge (lead oxide) and pulverized charcoal. The pulp and fluxes are well mixed, covered with borax, and the crucible placed in a heated assay furnace. What action takes place? The whole mass gradually becomes a bubbling, pasty fluid, and the innumerable particles of pulverized charcoal reduce a certain amount of litharge to the metallic state, so that thousands of minute lead globules go swimming and diving through the molten fluid, catching up and alloying with them all the precious metals contained therein. When the fusion is complete, the crucible is removed and the contents poured into a mold, the lead sinking below the lighter, liquid slag. After cooling, the glassy or stony slag and the lead are easily separated, and the latter is pounded into a cubical button weighing about one-third of an ounce. In order to effect the separation of the silver and gold from the lead, cupels are used. They are made from comminuted burnt bones, sometimes mixed with wood ashes, slightly moistened and molded into cylindrical-shaped masses, hollowed sufficiently at the top to hold the lead button when melted. The button is placed in the cupel within the muffle furnace, which is kept at a temperature sufficient to volatilize the lead but not the precious metals. The lead oxidizes and is partly absorbed by the cupel, the other part passing up the chimney. Fumes continue to rise and the melted metal grows smaller and smaller until the remaining little globule begins to spin like a top and then assumes all the colors of the rainbow. This indicates that the last traces of lead are being absorbed. Now the globule brightens and we carefully withdraw the cupel from the muffle, the operation being completed.

We note that the bright silver or lead button in this especial case is a little larger than a pin head, and, on being detached, brushed and placed on the button balances, weighs sixteen milligrams. This shows there are sixteen ounces of silver and gold to the ton of ore, because we took one assay ton of pulp, and an assay ton bears the same ratio to a ton of 2000 pounds that a milligram does to an ounce Troy. The button is now digested in nitric acid, which takes the silver into solution and leaves the gold in a spongy form. This is carefully washed, dried and ignited. Our delicate gold balance indicates that it weighs $\frac{3}{10}$ of a milligram, hence the ore carries $\frac{3}{10}$ of an ounce of gold per ton—the remainder, or $15\frac{7}{10}$ ounces being silver, from which we can readily estimate the value of the ore.

A third question, as below, was answered by Mr. Vernon as follows:



If you had set before you two pieces of ore consisting of iron and copper pyrites, how would you distinguish one from the other by simple inspection?

Copper pyrites differ from iron pyrites in the degree of color, being a deeper yellow, often tarnished in blue, purple and black hues, while iron pyrites have a pale to brassy yellow color with a brown hue when tarnished. Copper pyrites generally occur in a massive form; iron pyrites crystallize more frequently in the cubical system. The former is harder, being 3.5—4 in the scale of hardness, the latter 6—6.5. When the green and blue carbonates of copper occur in an ore with pyrite, the latter is more apt to be copper pyrites than the iron sulphide, as the carbonates have probably resulted from the decomposition of the sulphide of copper.

RECRUITING for Col. Griffin's brigade of volunteer engineers is going on all over the country. The brigade is limited to a total of 3500 men. The Washington *Star* says: "The engineer troops will be armed and drilled as infantry. They are line troops and must take their places in the line of battle when necessary. Their engineering duties will be the construction of and destruction of fortifications, field works, entrenchments, bridges, roads, railroads and tunnels, and will embrace field engineering work generally, besides map making and field reconnoissance work, photography, operation of stationary and locomotive engines, and electric apparatus, etc. Recruits, therefore, must be foremen, skilled mechanics of various sorts, handymen and first-class laborers, machinists, electricians, telegraph linemen, carpenters, timber framers, bracers, tunnel men, bridge men, iron men, erectors, riggers, blasters, quarrymen, lumbermen, boatmen and railroad men. Two cooks are also required for each company, also stationary and locomotive engineers and firemen. Allowances in addition to pay will be rations, bedding, all clothing, medicines and medical attendance. The volunteer troops will be disbanded and discharged as soon as the war is over, but no man should enlist, it is announced, unless he is prepared to serve for the full two years. Men should not be tempted to enlist by the hope that war will be over in a month or two, and that then they can return home."

The Mexican Railway's Double-Header.

Travelers over the Mexican railway from the City of Mexico to Vera Cruz are always greatly impressed with some of the engines they see in use on that line. The accompanying cut, for the use of which we are indebted to *Modern Mexico*, presents a view of one of these double-headers. The Mexican railway has twelve of them. Each weighs 100 tons, and is capable of hauling 190 tons up a 4½ per cent grade. They are of Scotch manufacture, built by the Fairlie Co. of Glasgow, and have been in the service of the Mexican road about ten years. These double-headers are used by no other road in North America. Not all of the engines used by the Mexican railway are of Scotch origin, however. They have a number of English manufacture, but a majority of their equipment of sixty-four engines were constructed in the United States.

A DOUBLE-HEADER USED ON THE MEXICAN RAILWAY.

Large Hoisting Works.

A steel gallows (said to be the largest in the world), now building at the War Eagle, B. C., mine, will cost $25,000 and will have a daily capacity of 1000 tons. From the ground to the axle of the head pulley is 100 feet; the shaft house building is 120 feet high, 180 feet long. The frame is constructed at the mouth of a new shaft being sunk from the summit of the hill at the rear end of the present main tunnel. It is through the new shaft, by means of the new hoisting works, that all the mine will be operated. It will be of sufficient capacity to reach the 3000-foot level. Among the devices for the economic handling of ore are three ore bins—one for waste, one for sorting ore, and one for the first-class product of the mine, their mouths located two-thirds of the way up the gallows, underneath the skip way. As the loaded skip reaches the mouth of the bins its contents will be dumped into the proper bin, and the skip itself is ready to return underground. The sorting ore, after being dumped, is passed by gravity over a fine grizzly, separating the smaller portions, which fall into the first-class bin, and are smelted with the high-grade product. Continuing on its way downwards, the sorting ore then passes through a grizzly with 6-inch spaces. The rock too large to pass the grizzly falls upon the sorting floor, where it is roughly hand-picked, and then passes through a Gates crusher, which reduces it to the standard size and forwards it to a self-feeder, where it meets the ore that passed through the second grizzly. From the self-feeder the ore, now of a uniform size, falls upon an endless belt that carries it past the sorters, which pick out the waste and per-

mit the ore to fall into the main receiving bin, where it is ready to be dumped into cars. Throughout the whole operation the ore will be practically handled and sorted automatically. The skips, two in number, with a capacity of three tons each, are being made by the Anaconda Co. at Butte, Montana. They will weigh two tons each and will be equipped both with a hood and a safety clutch, to prevent accidents in case the cable breaks. It is proposed to place skeleton cages beneath the skips for the use of the miners.

A Great Irrigation Enterprise.

The extension of irrigation facilities is of prime industrial importance. Both the individual undertakings by which water supply is developed, and the larger enterprises by which districts are supplied by good engineering and financiering, are a contribution to the producing capacity of the State and a means for its industrial advancement. Just how great enterprises should be planned and realized with justice to all interests involved is a question concerning which there are differences of opinion and upon which legislatures and courts still have much to do. Without attempting analysis of principles and methods involved in each undertaking, we can but express general satisfaction when water is made to flow out upon land which is by that means enhanced in valve and increased and ensured in production, independently of a fickle rainfall. From this point of view much interest pertains to a recent great irrigation event, viz., the completion of the Turlock irrigation enterprise in the San Joaquin, Cal., valley.

This enterprise is now eleven years from its inception and it has been carried to completion by surmounting difficulties of all kinds and was apparently rescued from failure by Ex-Judge James A. Waymire of San Francisco, who took up the abandoned contracts three years ago and has now brought the enterprise to a successful termination. The Turlock irrigation system is held to be among the most important in the United States, from the supply of water obtained, the quantity of land to be watered, its transportation facilities and the thoroughness with which the system has been worked out.

The Turlock irrigation district contains 176,210 acres, of which 139,510 are in Stanislaus and 36,700 are in Merced county. Soon after the passage of the Wright law, the people formed the Turlock irrigation district, on June 6th, '87. To carry out the work proposed $1,200,000 in 6 per cent bonds were issued. Of these $1,000,000 were sold at 90 cents, and have paid for the work done, the $200,000 remaining in the treasury to be expended in the completion of 120 miles of distributing canals.

The source of the water supply is the Tuolumne river, which is fed by the melting snows of the highest Sierras, and is therefore inexhaustible. Both the Modesto and the Turlock districts gather the volume of water pouring down from the mountains by means of the Tuolumne river dam, said to be the largest overflow dam in the United States. It measures 336 feet from bank to bank, is 129 feet high, 104 feet thick at the base and 20 feet at the crest. The overflow is 160,000 cubic feet a second, and the cost of the construction was nearly $500,000. From this immense dam at La Grange the water is led through a tunnel, 16 feet wide by 14 feet high and 600 feet long, to the main canal. For a distance of two miles this canal is cut in many places through the solid rock, and is 10 feet deep and 30 feet wide. In addition there are four flumes, which have been constructed during the last year. Flume No. 1 is a short distance below the great dam, is 200 feet long, and rests on a rocky foundation. Flume No. 2 spans Morgan's gulch for a distance of 560 feet on trestle work at a height of 60 feet. Flume No. 3 has similar support and height and crosses Dry creek at Delaney's ranch. Flume No. 4 traverses Peasley creek, also rests on trestles, is 40 feet in the air and about 400 feet in length. In all the main conduit system is twenty miles long, and its capacity is 1500 cubic feet, equal to 75,000 miners' inches of water, more than sufficient to irrigate 375,000 acres of land.

The cost, under the Wright irrigation law, is met by a land tax, which, in the Turlock district, will be at the rate of 40 cents an acre. At the same time it is estimated that the actual value of the land in this district will be increased from $4,500,000 to $9,000,000, the average value of water rights in California being placed at $53 an acre, and in the United States as a whole at $26 an acre. While the average cost an acre for an irrigation system is $8.15 in the United States, and in this State $23, the cost of the Turlock district system is said to have been only $6.81 an acre. The work has been a long, if a not very expensive, scheme, and that the enterprise has at last been carried out is a matter of satisfaction to those who have labored to secure it.

The engravings on this page are from recent photographs, and illustrate some of the chief constructive features of the enterprise; in the upper one the artist and the engraver have succeeded in producing the natural perspective in looking through the tunnel to daylight at the farther end.

SOME STRIKING FEATURES OF THE TURLOCK IRRIGATION SYSTEM JUST COMPLETED.

A RUSSIAN chemist has suggested the following methods for making wood water-tight: Coat the wood with a mixture of potassium bichromate and gelatine, and expose in the light. 2. Immerse the article in a warm solution of paraffine, to which some solution of gutta percha in benzole has been added. 3. Paint with a mixture of caseine, quicklime and albumen, well mixed. After coating with any one of these substances the film should be rubbed down with pumice, then painted with good oil paint, rubbed again with pumice and then varnished.

WHAT is believed to be the tallest flag pole in San Francisco now carries a 40-foot silk flag that waves over the MINING AND SCIENTIFIC PRESS office. It is 70 feet in length, and is stout as the mainmast of a ship.

Some Metallurgical Methods at Broken Hill, Australia.*

NUMBER V.

Amalgamation was discontinued one year ago. The extraction of silver was satisfactory, but the specific gravity of the ore was high enough to always interfere with the separation of the mercury in the settling pans, and one would see masses of manganic iron slime that were full of mercury in the finest state of division, of course carrying silver, with which nothing could be done economically to extract the locked-up mercury. It soon resolved itself into a matter of the cost of mercury, but if an ore of about twenty to twenty-two ounces of silver had been obtained steadily for the amalgamation work, there was no doubt of its superiority to the leaching plant, because the loss remained the same whether on fourteen-ounce or on twenty-ounce ore, a rule which did not act so well with the leaching. As the grade of ore necessarily low in lead could not be obtained in large enough quantities to keep the whole of the plant going, it was stopped. Its capacity was about 1000 tons weekly. There were sixty stamps erected with a drop of 6 inches, weighing 850 pounds each, and ninety-five drops a minute. The remainder of the plant consisted of four grinding and twenty-four Howell amalgamating pans, each 4 feet 6 inches in diameter and 3 feet 4 inches deep, the first-named pans running forty revolutions a minute, and the latter seventy-five to eighty revolutions. There were also twelve settling pans running fourteen revolutions a minute, each being 8 feet in diameter and 3 feet 6 inches deep, the whole of the pans being cast iron.

Towards the latter end of the operations it was found that sulphate of copper was not necessary for the successful extraction of the silver in the amalgamating pans, and it was not an uncommon thing to have the retorted bullion from this plant, after the use of the bluestone was stopped, running 996 to 999 fine in silver.

Concentration.—The first attempts at concentration were made on the low grade carbonate ores. The evil day of sulphide treatment had not yet come. The ore sent to the concentration department was highly silicious, low in lead and silver, and if the ore had been specially mined for the purpose of concentrating it, there is no necessity to hesitate over the fact that it was not a payable proposition. But, like the low-graded ores which are chloridized and leached, this ore had to be taken out, whatever use was made of it afterwards. The cost of mining it was borne by the smelting ore necessarily, and placing the matter on a common ordinary bookkeeping footing, this low grade stuff cost nothing delivered on the surface. Its value ran from 7 to 12 per cent lead and from six to fourteen ounces of silver, and the question was, Could this low grade material be concentrated at a profit? Without further treatment the ore was worthless, but the carbonate concentrate that was produced from the ore was infinitely preferable to use in the furnaces than the crude sulphide ores. Looked at in these days, when carbonate ore high in lead is getting to be worth more than the value of its metallic contents, there would be no hesitation as to what would be done with the low grade ore, but in those days, when lead ore in the carbonate form was plentiful, when the value of a ton of lead in Broken Hill was but 50 per cent of its London market price, the wisdom of some of the immense concentration plants which were erected seems doubtful. Block 14, the British Co., and the Proprietary rushed into enormous expenditure, whereas one only of the first concentration plants erected would have demonstrated forevermore their uselessness on the class of ore that had to be treated. The first system of concentration was with the Col-

* Condensed.

lom jig and after-treatment to recover the rich slimes by a kind of Linkenbach table. The ore was first crushed with an enormous steam-eating stamp, the very worst system of crushing which could have been devised for this class of ore. Think for a moment of the composition of the ore—a hard quartz and a friable carbonate of lead. Every blow of the stamp shattered the quartz into fragments—of that there could be no doubt—but it smashed the bulk of the carbonate of lead into slimes. The stamp was somewhat like the whole plant—there was no economy in the structure of either, and when finished neither did the work expected of them. Both the stamp and the jig were splendid appliances for dealing with ore like they have at Lake Superior, from whence they were imported, where the ores were copper, the latter existing almost—if not altogether—in the metallic form. No smashing blows could do any mischief on this class of material, and the large crushing capacity of the steam stamp was thus an advantage. Time went on, and the steam stamp was thrown out on the scrap heap, and a good many of the Collom jigs also. Alterations were made in their motions, notably at the British mine, where the tappet motion of the plunger was altered and driven with an eccentric, so giving a more even pulsation in the jig. This improvement was a good one, and if the size of the jigs had been about three times greater, considerably better recovery would have been made, for, after all, the Collom jig, as used in Broken Hill, was but a toy. As the carbonate ores began to disappear, the attention of the mine managers was impelled to the sulphide problem, of which volumes have been, and no doubt will yet be, written. The recovery of the first jigs did not amount to more than 48 to 54 per cent of the lead, but in spite of the low recovery the size of the jig allowed large quantities of ore to be rushed through them at the minimum of cost. As soon as it was found that some profit could be made out of the hitherto hopeless sulphide ore, even with such an extravagant loss of lead, more attention began to be paid to the retreatment of material rejected from the last hutches. These were crushed finer and passed through a second jig, and the same process was gone through with the low grade product of the hutches of this jig, passing it through a third jig, so that with the addition of slime buddles something like 65 per cent to 75 per cent of the lead contents of the ore treated is now recovered from the crude ore. The crushing machinery adopted for the ore with these jigs is the ordinary jaw-crusher on the old Cornish principle, with a set of Cornish rolls for finer pulverization.

It is stated that 75 per cent to 80 per cent of the lead contents of the crude ore is recovered by the Block 10 concentration plant, which is certainly the best work that is known yet. The plant is capable of treating over 2000 tons of crude ore weekly. The assays of the crude sulphide of lead, given earlier, are about the average value of most of the sulphide ores which are being concentrated, if we accept the South mine, which is higher in lead and lower in zinc and silver.

Costs vary with the different plants, and from 4s. 6d. to 7s. 6d. a ton on the crude ore are about the limits between which the costs at the different works lie. The recovery of the silver is the weak point in the concentrating process in Broken Hill, seldom more than 40 per cent of the silver contents being recovered in the lead concentrate. The reason is the zinc blende in the ore contains about an equal bulk of the silver, and the more successful the concentration to get rid of the zinc, the more successfully the silver is removed also. I think close investigation will show that this estimate of the distribution of the silver in the ore is a fairly accurate one, but it would be interesting to have more information on the subject. Hence in all the concentration plants at work in Broken Hill a difficultly marketable bye-product of zinc tailings is produced, running high in zinc and silver (up to 40 per cent zinc and twenty-five to thirty-five ounces silver per ton). The higher grades of this particular material are produced at Block 10, and they are content to accept as low as 10s. per ton for this production when a buyer is to be found.

(*To be Continued.*)

Cyanide Experience in Montana.

Matt W. Alderson, in the Helena, Mont., *Independent*, gives an account of his experience with the cyanide process in Deer Lodge and Madison counties:

From my earliest connection with cyanide work, I realized that the day of tailing piles would soon be past and the successful cyanide man would be he whose power of adaptation would be such as to enable him to fit leaching by cyanide to the regular crushing and concentrating part of a mill, thus making one handling of the ore all that would be necessary. The difficulty in the way of handling slimes having been overcome by agitation and subsequent settling and decantation of the gold-bearing fluid, a still greater difficulty presented itself in the enormous amount of cyanide necessary in direct crushing, it requiring ordinarily about seven tons of fluid to wash a ton of ore through the screens of a stamp mill. I have constantly had in view, therefore, more than anything else the past two years, the question of reducing the cost of cyanide per ton of material treated. How well I have succeeded will be shown in the following table:

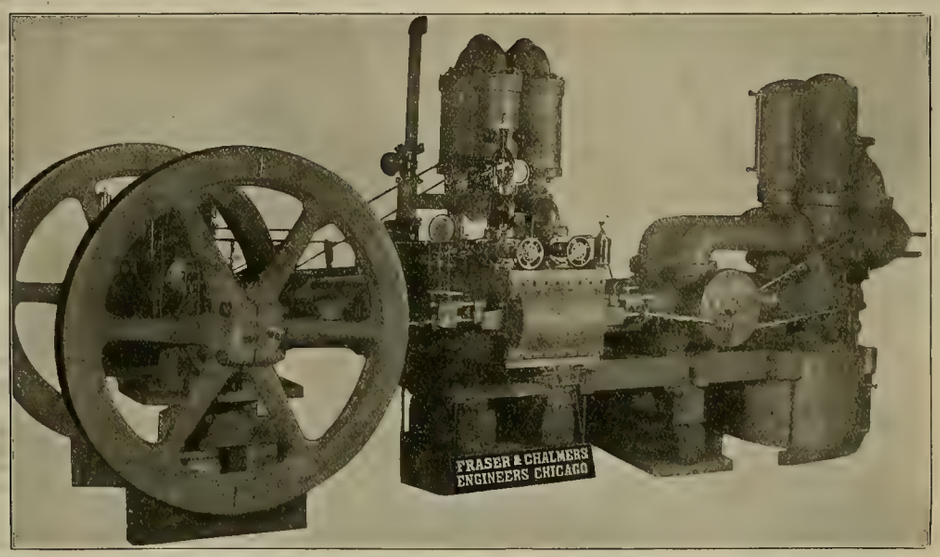
Run of 287 tons at Iron Rod, Oct., 1896.

Run of 468 tons at Mohegan mill, Red Bluff, Sept. 24 to Nov. 8, 1897.

Run of 145 tons at Mohegan mill, Red Bluff, April, 1898.

	Iron Rod.	*Mohegan.*
Cyanide, per ton	$1 70	$1 0003
Other chemicals	06	0502
Zinc	0775	0817
Labor	1 88	1 0471
Assaying	10	1007
Incidentals	0745	075
Total cost per ton	$3 20	$2 355

A reduction at Mohegan mill of 84.5 cents per ton.



First 142 tons treated at Mohegan mill in fall of 1897 cost for cyanide, 510 pounds	$163 20
First 145 tons treated at Mohegan mill in 1898 cost for cyanide, 180 pounds	57 60
Saving in 1898 over 1897	$105 60
Cost per ton for cyanide, six weeks' run at Mohegan mill, 1897	$ 1 00
Cost per ton for cyanide, first 145 tons at Mohegan mill, 1898	40

Saving in one item of expense, in 18 months, 76 4 per cent.

In the face of these figures the apparent difficulties in the way of direct treatment were overcome, and the Mohegan mill commenced crushing ore. The ore from the Mohegan mill is dumped from wagons onto a grizzly, the coarse ore going to a Dodge crusher. From the bin below the ore passes automatically through a Challenge feeder to the battery. Here it is crushed in cyanide solution, passing through a 45-mesh No. 35 wire screen to the plates. Such coarse gold as the ore contains is thus recovered in the usual process of amalgamation. The pulp is conveyed from the foot of the plates by a launder to the agitator, where it is agitated for such a length of time as is deemed necessary. Experience has demonstrated that on the Red Bluff ore we can get all in solution, susceptible to the solvent action of cyanide, in from three to five hours. We therefore run the battery during the day time, fill one agitator—built to accommodate a day's run—and agitate and decant the necessary solutions during the night. The decanted fluids pass on through the extractor, where the gold is removed, and the fluid is again ready for the battery. The pulp in the agitator is discharged without handling, so from the time the ore enters the mill it travels its regular course without expense for labor. The process is thus continuous, economical, free from complications, susceptible to enlargement to any scale desired, requires no change in an existing plant, but becomes a valuable and comparatively inexpensive addition thereto.

Duplex Differential Riedler Pump.

Discussion of deep mining on the Comstock in the issues of Jan. 15 and Feb. 5, the matter of drainage, and the practicability of continuing at greater depth, lend interest to the recent placing of a Riedler pump in the Allison Ranch mine at Grass Valley, Cal., illustrated herewith. This pump was built by Fraser & Chalmers of Chicago for Mackay & Flood and installed last March. It is driven by a pneumatic cross compound engine; air reheated before entering high pressure, and again between high and low pressure cylinders; normal capacity, 700 gallons per minute against 500 feet head. All parts designed to stand a working pressure of 1200 feet vertical head. Its cost is about $5000. The pumping plant at the Union shaft on the Comstock had a capacity of about 800 gallons per minute, but it cost at the time approximately three-quarters of a million. Coupled with the comparatively small first cost of the Riedler, working tests also show a saving in operating expenses. The photo from which the accompanying cut was made was taken by flashlight in the mine, the background being removed to bring out the pump itself more distinctly.

DUPLEX DIFFERENTIAL RIEDLER PUMP.

Dumping Pan Conveyor.

Herewith is shown an illustration of the dumping pan conveyor manufactured under patents controlled by the Jeffrey Manufacturing Co. There has been for a long time a demand for a conveyor that possessed the advantages of carrying the load instead of scraping it along, that would at the same time discharge its load at any desired point along the line. This conveyor fulfills the requirements to an eminent degree, and, being carried by chains placed entirely outside and away from the gritty material, it can be depended upon for durability, as this feature also admits of running at a moderate speed. The capacity of this conveyor is unusual. The discharge is effected by allowing the truck wheels which support the pans to fall into depressions in the track at the desired points; when it is required to carry over these points, then a straight piece of track is swung into place.

DUMPING PAN CONVEYOR.

Further particulars may be had by addressing the Western branch of the above company at No. 844 Equitable Building, Denver, Colorado.

Coast Industrial Notes.

—Astoria, Or., millmen are paying $5.75 per M. for spruce logs.

—Port Angeles, Wash., and Victoria, B. C., are now connected by cable.

—Operations have begun on the Skaguay-Lake Bennett railway. Two hundred and fifty men are working at $3 a day.

—It is thought that $5,000,000 will be withdrawn from San Francisco savings banks for investment in United States war bonds.

—It is estimated that 80,000 sheep will be sheared in Kittitas valley, Wash., this year. The clip will average ten pounds to the animal.

—The Los Angeles, Cal., City Water Co. asks that city $3,000,000 for its water plant, including Crystal Springs; without Crystal Springs, $2,000,000.

—Of the Southern California line Gen. Mgr. Nevin has written that the business situation all through southern California has greatly improved during the last sixty days.

—The Stockton & Tuolumne Co., Cal., railroad is surveyed to Copperopolis. The steepest grade is 106 feet to the mile: the chief engineer figures the cost of the road to there at $8,927 per mile.

—The Oregon Improvement Co.'s coal business is at present earning the company $40,000 a month. The entire April net earnings of but $35,000 showed a material falling off from previous months, due to the sudden cessation of the Klondike rush.

—The Santa Fe Railroad Co. is now using oil on fifty-two locomotives. The average consumption per locomotive is about 500 barrels a month. There are on the two roads nearly 100 locomotives using oil. Thus the railway consumption in southern California alone is about 50,000 barrels a month.

—The Pacific Coast Borax Works, near Oakland, Cal., has made evaporative tests of southern California crude petroleum from the Summerland and Los Angeles districts. In the former a consumption of 2010 pounds developed 819 H. P.; in the latter a consumption of 1460 pounds developed 662 H. P.

—A contract has been let for the construction of a line of poles from Crafton to Los Angeles, Cal., for the Southern California Power Co., to carry electric power from the large power works in the Santa Ana canyon to Los Angeles. This will be the longest distance over which electric power of any considerable amount is carried in any part of the world. There are 125 men at work in the canyon completing the work. The long line of poles are to be up by Aug. 1.

—Mexican capitalists are said to have a concession to utilize for the generation of electric current fifty-six waterfalls, five of which are in the State of Chiapas, forty-five in Campeche, two in Tabasco, two in Oaxaca, one in Guerrero, one in Hidalgo and two in the State of Mexico. It is announced that the original concessionaires have sold their rights to a company in New York, and that the latter propose to establish 122 new industries at different points of the country, which will utilize electric power.

—Tacoma, Wash., reports that the Standard Oil Co. has decided to ship 250,000 gallons of kerosene up the Yukon river this summer. It is stated that the company intends to supply hereafter all the oil needed in the Klondike and other settlements on the Yukon river for lighting purposes, fuel, and for operating the frost extractors used in mining. The company has purchased a river steamer and a large barge, which are to be delivered at St. Michaels this month. In addition to these a 1000-ton schooner has been purchased, which will take on 20,000 cases of oil at Tacoma for St. Michaels. Oil sold as high as $30 a gallon at Dawson City last winter.

—The commercial importance of the Philippines as an American acquisition is emphasized by a series of tables issued by the National Bureau of Statistics. The victory at Manila was startling in its effectiveness and dazzling in its completeness from a purely naval standpoint, but is destined to be of more consequence than a mere stroke of naval strategy. The guns that destroyed the Spanish fleet in Manila bay thundered a warning to the nations of our approaching commercial supremacy in the Orient. The tables issued convey an idea of the commercial opportunities awaiting us in the countries adjacent to the Philippines, and the value of this field for Pacific coast traders and manufacturers is manifest. The significant fact disclosed by these trade reports is the increasing demand for the class of articles produced in the United States. Taking this territory adjacent to the Philippines—including China, British India and East Indies, Japan, Corea, Hongkong, Asiatic Russia and Oceanica—the exports of the United States are shown to have increased from $27,421,831 in 1893 to $61,927,678 in 1897. This commerce, however, is still less than 6 per cent of the total imports of these countries, showing the vast field which awaits producers and traders. The United States must have more than 6 per cent of the trade of those countries, whose doors are now open to the commerce of the world. With the Philippines as a base of supplies for our merchant vessels, it would be only a question of a few years when we would supply the Japanese and Chinese with the bulk of all their imports in clothing, breadstuffs, machinery, iron and steel products.

—Secretary of the Treasury Gage recommends the appropriaaion of $250,000 for the payment of wages of workmen and the contingent expenses at the mints in coining gold and subsidiary silver for the next fiscal year, together with an elaborate statement of the gold bullion now in the treasury and the needs for its conversion for prompt use. The appropriation is to enable the mints to convert a large part of the gold bullion now on hand, as well as to coin the current domestic deposits that will be made. The secretary calls attention to the $97,000,000 held in the treasury on June 1st and the apparent necessity for its conversion into coin at an early date to be applicable for disbursement from the treasury in case it should be required. Continuing, the secretary says: "Of the gold bullion in the treasury $92,000,000 is held at the assay office at New York and at the mint at Philadelphia, and to reduce the stock in a reasonable time it will be necessary to run overtime at the Philadelphia mint for several months. While the stock of gold bullion on hand at San Francisco at the present time is about $4,500,000, it will be increased in July and August by receipts from the Klondike, most of which will be deposited in that institution. Conservative estimates place the amount that will be received from the Klondike during July and August at not less than $12,000,000 to $15,000,000, and it will probably be necessary to work the mint at San Francisco overtime for two or three months. Especially will this be necessary should further importations of gold be made from Australia."

Personal.

G. H. ROBERTS, Director U. S. Mint, is in San Francisco.

G. MCAULEY is Supt. Mayflower mine, Forest Hill, Cal.

J. R. LIGHTFORD becomes Supt. Butte Bell mine, Nimshew, Cal.

W. F. DETERT, Supt. Argonaut mine, Jackson, Cal., has returned home.

F. CHAPPELET has resigned as Pres. Mayflower mine, Forest Hill, Cal.

F. ZEITLER, Supt. Champion mine, Nevada City, Cal., is in San Francisco.

R. V. HALTON, Supt. Ormonde mine, Washington, Cal., is in Oakland, Cal.

J. R. PHILIPS, Supt. Amador Queen No. 2, Jackson, Cal., is in Toledo, Ohio.

JOHN HAYS HAMMOND is expected in California from London next month.

LIEUT. GOV. A. E. SPRIGGS becomes Gen. Mgr. Ruby mine, Basin, Montana.

T. CLARK, Pres. El Dorado County Miners' Association, is in San Francisco.

G. STARR, Gen. Mgr. Empire mine, Grass Valley, Cal., is in San Francisco.

G. STARR, Gen. Mgr. Empire mine, Grass Valley, Cal., is in San Francisco.

M. W. MATHER, Supt. Plumbago mine, Alleghany, Cal., is in San Francisco.

W. MCKINLAY, Supt. Providence mine, Nevada City, Cal., is in San Francisco.

G. MAINHART, Supt. Omaha Con. M. Co., Grass Valley, Cal., is in San Francisco.

J. R. TREGLOAN, Supt. Keystone mine, Amador City, Cal., is in San Francisco.

W. C. RALSTON AND G. W. GRAYSON of San Francisco are at Winnemucca, Nevada.

H. E. PICKET, managing owner Grand Victory mine, Placerville, Cal., is in San Francisco.

W. I. SMART of New York is examining mining properties in Sierra and El Dorado counties.

H. VAN F. FURMAN is at Cairo, Egypt, and expects to return to the United States next January.

F. A. WING will be in charge of the new assay office at Seattle, Wash., at an annual salary of $2500.

CAPT. THOS. MEIN, consulting engineer of the London Exploration Co., has returned from Jackson, Cal.

J. F. WEBB, Mgr. and part owner Pocahontas mine, Placerville, Cal., is in San Francisco en route to St. Louis.

J. B. WHEELER, New York City, is visiting the Plumbago mine at Alleghany City, Cal., in which he is part owner.

H. PICHOIR, managing director in the London Exploration Co., has returned from a visit to the Oneida mine, Jackson, Cal.

CHAS. A. BUTTERS is in Denver from Johannesburg, South Africa, on his way to San Francisco via Salt Lake City, Utah.

J. EDWARDS, New York City, is in San Francisco en route to Mexico, whence he returns to California to examine properties in El Dorado county.

JOS. MCGILLIVRAY left yesterday on the Humboldt for Dawson. He takes up some boring and thawing machinery, on which he recently secured patents.

J. C. MCCOOK, the newly appointed Consul to Dawson, N. W. T., and N. H. Burke, Vice-Consul at the same place, are at Vancouver, B. C., on their way to Dawson.

MR. EDWARD L. BRAYTON of the Pelton Water Wheel Co., who has been at their New York works for some time past, has gone to England on business for his company.

Catalogues, Etc.

THE finest hanger received at this office this year is that of the Wm. Powell Co. of Cincinnati, O., showing their Star valve. Topographically, 'tis evident the valve is a world-wide institution; typographically, the card is unique and attractive. The Wm. Powell Co. will mail a copy anywhere upon request.

AN unusually fine catalogue and price list is issued by the Lunkenheimer Co., Cincinnati, O., of their makes of steam specialties, admirably arranged for reference and handsomely illustrated, and containing several useful tables. A copy will be mailed to any address upon application.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 7, 1898.

605,079.—WINDMILL—J. Coats, Olive, Cal.
605,403.—DENTAL BRIDGEWORK—C. A. Davis, Pasadena, Cal.
605,279.—SAFETY LOCK FOR ELECTRIC LAMP—Faller & Herbstritt, S. F.
605,417.—BICYCLE STEERING HEAD—A. C. Garcia, Modesto, Cal.
605,460.—ROTARY ENGINE—M. E. Gilbert, S. F.
605,445.—WATER BATTERY—R. H. Gorter, S. F.
605,251.—TROLLEY HANGER—G. E. Johnson, Los Angeles, Cal.
605,200.—HYDROCARBON BURNER—C. R. Kittle, Los Angeles, Cal.
605,333.—IGNITER—O. Owens, S. F.
605,450.—NUT—R. R. Parrish, Independence, Ogn.
605,337.—LOCK—G. L. Petorin, S. F.
605,341.—TELEPHONE—Reid & McDonnell, Tacoma, Wash.
605,187.—PUMPING ENGINE—E. A. Rix, S. F.
605,345.—CALL-BOX SYSTEM—Salisbury & Dean, Tacoma, Wash.
605,238.—HOSE COUPLING—W. A. Sutlin, Marysville, Cal.
605,358.—SIGNAL—Taylor, Salisbury & Dean, Tacoma, Wash.
605,150.—FLUSHING TANK TRIP—E. E. Townsend, Capitola, Cal.
605,151.—BICYCLE SADDLE—J. F. Twist, S. F.
605,211.—TROLLEY SWITCH—J. H. Vanasselt, Seattle, Wash.
605,440.—PENCIL SPLICER—F. W. Warren, S. F.
605,366.—DOOR ALARM—G. D. Winters, Reno, Nev.
605,266.—STAMP MILL FEEDER—G. Wood, Prescott, A. T.
28,799.—DESIGN, SEAL PRESS CASE—A. H. Mackinon, Olympia, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAFETY LOCKS FOR INCANDESCENT LAMPS.—Ernest Faller and Herrmann Herbstritt, San Francisco, Cal. No. 605,279. Dated June 7th, 1898. This invention relates to a locking device which is designed to prevent the surreptitious removal and stealing of incandescent-light globes. These globes are ordinarily screwed into permanent sockets with which the wires connect, where the proper contacts are made, so that by turning the key the electrical current will pass through the filament and produce the light, which may be closed by reversing the movement of the key. Much annoyance and difficulty have resulted from the ease with which these globes can be disengaged from the permanent socket, and they are very often stolen or removed, so that it is necessary to supply the loss with new ones. This device is intended to prevent this surreptitious removal. It consists in forming the metallic end which is fixed upon the globe and adapted to engage with the corresponding portion of the permanent fixture, with a catch which forms one of the engaging parts and a corresponding automatically engaging tongue projecting inwardly so that it is concealed within the exterior portion of the fixture. When the globe is secured into place, the catch and tongue engage with each other and prevent the globe from being again removed until it is disabled, when it can be removed by breaking the globe so that the catch can be reached and disengaged to allow the metallic threaded portion to be removed.

PENCIL SPLICERS.—Frank W. Warren, San Francisco, Cal. No. 605,440. Dated June 7th, 1898. This invention relates to a device which is especially designed to splice or connect two different pencils, so that either two pencils of different colors or qualities of hardness may be used or to enable the person to use up short ends of pencils. It consists of a short tube internally threaded, and with the threads so cut transversely as to form a sharp angle which makes the cutting-die so that the pencil can be screwed into the device and the thread will be cut upon it, which retains it in place. The ends of the holder may be made bell shape or diverging so that the pencil end can be easily introduced.

BICYCLE SADDLES.—Joseph F. Twist, San Francisco, Cal. Assignor of one-half to Lewis D. Radgesky of the same place. No. 605,151. Dated June 7th, 1898. The object of this invention is to provide a bicycle saddle having the front divided longitudinally, so as to form an open channel from the front approximately to the center of the saddle, the rear portion of which is closed, and to provide an adjustment for the saddle-front, by which the parts may be moved to or from each other to increase or diminish the space, and to adjust the saddle with reference to the rider's needs. It consists essentially of a segmental cantle, a leather covering, the rear portion of which coincides in shape with the cantle and is fixed thereto, the covering converging from the outer edges to the front end, and divided forwardly from a central point to the front to form independently adjustable pommels. These pommels have yokes connecting them transversely with slotted clamping bolts and nuts by which they may be clamped to the spring which extends beneath the saddle so that these front ends may be separated or moved beyond each other and locked in place. The saddle spring has a clamp which is adapted to be adjustably screwed to the top of the saddle posts, so that the saddle may be set at any desired angle and position with relation to the machine.

Harnessing the Sun.

When we sit in front of a coal fire, do we realize that the heat and light of the burning coal are really sunshine that has been stored up for ages? Centuries ago the sun shone on the earth, and plants and trees grew, fell, and grew again; they were covered by geologic deposits and acted upon by great heat and pressure, until in the course of ages these layers of organic matter were transformed into coal. The coal thus represents the work done by the sunshine ages ago, and when it is burned the imprisoned solar energy is loosened again. Our system of power production depends upon this presence of energy. But coal is a wasteful source of energy. Even the best engines do not utilize over 10 per cent of the calculated energy of the heat of coal. And besides this, it is an inconvenient thing in many ways; it has to be mined, freighted and stored. Can we not find some more economical way of using the sun's energy? During the last few years the great progress in electrical science has enabled man to utilize the solar heat in a thriftier way. During its day's work the sun draws up a large amount of water from the oceans and the damp earth. By the action of its rays plant life flourishes, and plants draw from the ground and evaporate into the air large amounts of water. Thus an oak tree of average size, with 700,000 leaves, lifts from the earth into the air about 123 tons of water during the five months it displays its foliage. This evaporated water, sooner or later, falls as rain and by the action of gravity begins to flow downward. Thus the great rivers are fed. Round and round incessantly goes the water lifted by the tireless sun, to fall when deserted by him, and again to be lifted, and again to fall and run seaward as long as it may exist upon this earth.

Recently Declared Mining Dividends.

Big Seven, Montana, $30,000; payable immediately.

Bullion-Beck, Utah, 10 cents per share, $10,000; June 15.

N. Y. Exploration Syndicate, $4.50 per share; June 15.

Wildman-Mahoney M. C., California, 10 cents per share; payable immediately.

Grand Central M. Co., Utah, 12½ cents per share, $31,250; June 15.

Homestake M. Co., South Dakota, regular monthly dividend, 25 cents per share; payable 25th.

Anchoria-Leland, Colo., $6000; June 11.

Elkton, Colo., 2 cents per share; payable immediately.

Portland, Colo., 1½ cents per share; $45,000; June 15.

Consolidated, Colo., 1½ cents per share; $120,000; payable July 1.

Parrott Silver and Copper Co., Montana, 3 per cent; payable July 1.

Commercial Paragraphs.

THE Union Iron Works of San Francisco has established a branch office at Bloomfield House, London Wall, E. C., London, Eng.

THE California Stump Puller Company of this city shipped five of its machines to the Hawaiian Islands last week on an order. This makes about a dozen in use on the Islands, which speaks well for the merits of the California Stump Puller.

THE Pelton Water Wheel Company has been awarded the contract for the hydraulic work of the new plant of the Central California Electric Power Co., to be installed at Auburn, Cal. This station is to embrace two 43-inch wheels, to run under 200 feet head at 300 revolutions, and develop 800 H. P. The wheels to be direct connected to a 500 K. W. Westinghouse Generator, which is to be electrically coupled to the generators running the Newcastle station of this company six miles distant, and the power transmitted to Sacramento over the same pole line, the entire distance from the Auburn station being thirty-four miles. The interesting features of this plant consist in running two stations so far apart in parallel; also in the double use of the water—it being the same as supplies the Newcastle station six miles lower down. With the rapid fall of our mountain streams power can thus be multiplied indefinitely from the same streams and generally within reasonable limit of transmission.

Recent California Mining Incorporations.

Demarest G. M. Co., Angels Camp; capital stock, $150,000; subscribed, $40,000; T. H. Fullen, D. C. Demarest, J. R. Darroh, G. E. Stickle, L. Monteverdi.

Pumping Water into a Tank.

So many inquiries have been sent to us, says the *Scientific Machinist*, asking for the best plan to adopt for piping water into a tank, that we herewith answer the questions in full, and hereafter correspondents will be referred to this issue.

In many places where a city water pressure is not available for filling tanks, water from a well or stream is used and put into a tank located at a greater or less height above the pump, so that more or less pressure is created by the fall as it is drawn off for use about the shop or factory. It requires much steam to raise water into these tanks, as it is usually done by direct-acting steam pumps that are not economical in the use of fuel. The question arises concerning the best way to arrange the piping so that the work may be done with the least expenditure of fuel and the lowest cost for piping.

The first thought seems to be that as the pipe is run up to the tank it will save piping if a proper connection is made so that the water will enter the bottom of it, for this arrangement not only saves the cost of piping the height of the tank, but it also admits of using the same pipe for drawing water off from the tank. But the objection is raised that if this is done the pump will have to force water against the whole body in the tank, and this will greatly increase the work on the pump. Let us reason the matter out and see if this is true. Taking the positive side of the argument, we must assume that the water in the body of the tank presses down with more force than it does in a small pipe set up alongside of said tank. If this view of the case was correct, of what use would the water gauges on

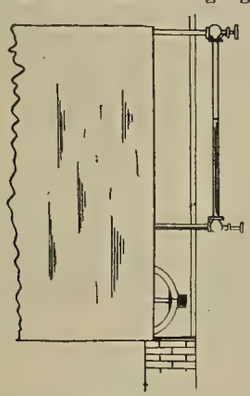


Fig. 1.

our boilers be to us? Fig. 1 shows a boiler-head with a water gauge on it, and we know that the water will stand at the same height in the glass as it does in the boiler, so that no argument is needed to convince us of this fact, but if the body of water in the boiler created a greater pressure than the same height of water in the small glass tube, then the latter would be forced upwards until the top of the glass was reached, and we could not tell where the water level in the boiler was, therefore the water gauge would be entirely useless.

Sometimes tanks are fitted up as

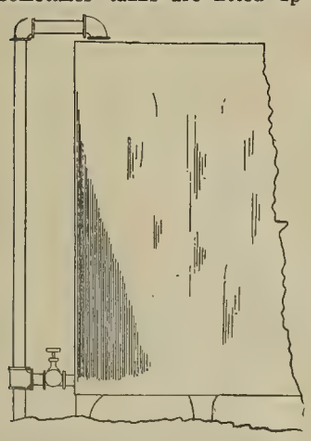

Fig. 2.

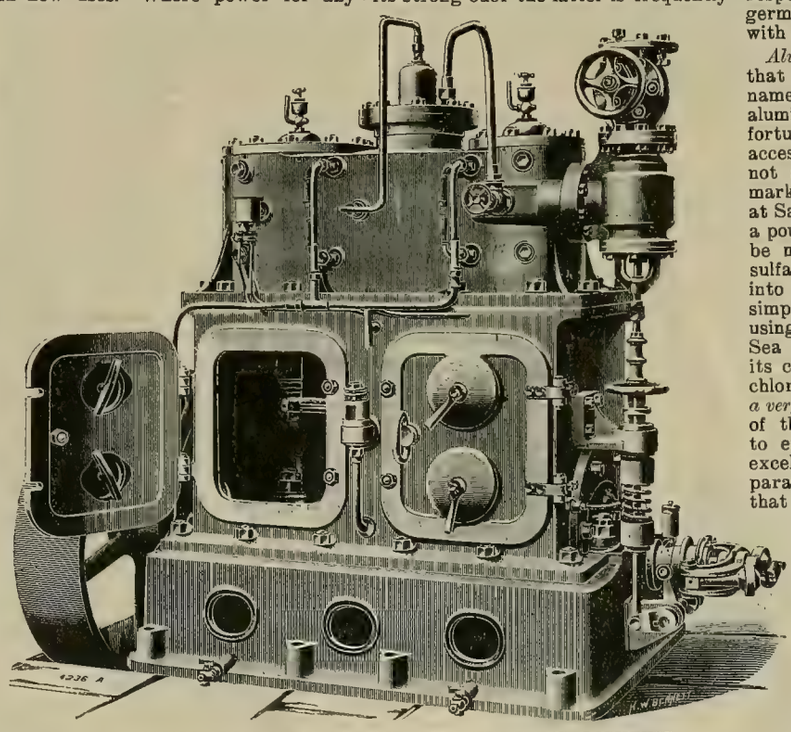
shown in Fig. 2, and when there is no water being forced through the pipes the height of water is just equal to that in the tank. From this it should be plain that it requires no more force to put water into the bottom of the tank than it does to force it to the same height in the pipe, and it follows as a natural consequence that it requires more force to put the water up through a pipe that extends several inches above the top than it does to put it into the bottom of the tank; therefore it is not only a waste of piping, but also a waste of fuel, in pumping against a greater head than is necessary.



The writer once had charge of a plant where the tanks were fitted up in this way, and when the valve shown was open no water would ever appear at the upper end of the pipe until the tank was nearly full, when the pressure, being nearly equal, the momentum of the water coming up through the pipe would cause some of it to appear at the end of it, but never until the tank was nearly full. This is only one of the many cases where sound theory agrees with good practice, and should be a convincing argument.

It is quite possible for the piping to be so arranged that when the pump is running at a high rate of speed the momentum of the water will carry it up through the pipe and over the top of the tank, but this would not be a fair trial.

It requires some labor to make a good joint where a pipe goes into the bottom of a tank; but it is necessary to make it for the outlet pipe, therefore the best plan is to connect the discharge pipe from the pump directly into the outlet from the tank, as this is the least expensive plan and also the best way to get water into the tank with the least friction.

Upright Enclosed Engine for Electric Lighting.

The extreme flexibility of electric power is being demonstrated every day in new uses. Where power for any purpose must be used about a large building, or any place where work is being carried on, it has seldom failed to prove its availability and economy. In excavating for the Central London Railway—the railway that was equipped almost entirely with American machinery—the contractors found that it was most convenient to generate current and transmit it to the various points where power was required. The engine shown on this page was used, direct connected to a generator. The subway was lighted, the pumps of various kinds operated and several locomotives driven by the current. The engine is a compound, not of American type.

UPRIGHT ENCLOSED ENGINE FOR ELECTRIC LIGHTING.

A Timely Discourse on Disinfectants.

By PROF. E. W. HILGARD, University of California.

With the advent of warm weather the demand for disinfectants and deodorants for domestic and hospital use becomes pressing, especially in view of the dry season and consequent liability of the water supply to increased contamination, and also of a scarcity of water for flushing the drains and sewers. It therefore seems timely to discuss briefly the main points in the premises, adding some suggestions towards facilitating and cheapening disinfection, resulting in part from investigations made on the subject during the past season. These investigations developed several curious facts regarding preparations commercially sold for these purposes.

Deodorants and Germicides.—Attention should first be given to the fact that many *deodorants* have but very faint *antiseptic* properties; and that only a few of the preparations commonly known as *anticeptics* are true *germicides*, that is, actually *kill* the foul germs, so as to render them incapable of further development; unless used in such quantities as to be too costly. Of those that have passed into more general use, bichlorid of mercury (corrosive sublimate), bleaching powder or "chlorid of lime" and chlorin gas, and sulphurous gas (from burning sulphur), are the most energetic germicides as well as deodorants. To these should be added the lately introduced formaldehyde or formalin gas, either generated from a lamp causing the incomplete combustion of wood alcohol, or sold in solution.

The substances mentioned, all poisonous, readily kill not only all disease germs of bacteria, but also the various forms of the common mould, which are among the most resistant. Salicylic and carbolic acids in proper concentration accomplish the same end, yet are much less energetic, and on account of its strong odor the latter is frequently objectionable. The same objection lies, in an aggravated degree, against chlorid of lime, free chlorin and sulphurous acid. It is the absence of odor and almost of taste, that has brought salicylic acid into such extended use. Yet even a fairly strong solution of salicylic acid is readily destroyed by the common blue mould when proper nourishment is supplied. It stands on the line between true germicides and mere *antiseptics*, that is, substances which prevent or greatly retard the *development* of diseased germs and bacteria, but without *killing* them save on very long exposure. The ease with which salicylic acid can be introduced into food products without its being observed by the taste has led to a widely extended illegitimate use, and to a marked increase of dyspepsia among persons using canned and otherwise preserved fruits, fruit juices and vegetables. For the disinfection of drains and closets, salicylic acid, even if its price permitted, would be but a poor resort.

Sulfate of iron, commonly known as copperas, is a fair deodorant and antiseptic; but just as in the case of carbolic acid, the odor is a practical objection, so in that of copperas the ineradicable stains it leaves everywhere are a nuisance to the housekeeper. For water closets and washstands, a *colorless* and *inodorous* antiseptic of sufficient efficacy and cheapness is the great desideratum, so as to prevent the generation of "sewer" gas, the absolute killing of the germs under ordinary conditions being of less moment.

Relative Antiseptic Effectiveness.—Of such substances there is a considerable number among the mineral or metallic compounds available in commerce. The great domestic preservative is common salt; but its efficacy is quite slight as compared with a number of others, as will be best seen from the table below, showing their relative antiseptic efficiencies. The data are partly taken from standard works, partly derived from experiments made by Mr. Bioletti, in charge of the bacteriological laboratory.

ANTISEPTIC RATIOS:

Bi-chlorid of mercury	14,800
Free chlorin	4,000
Salicylic acid	1,000
Aluminum chlorid	714
Aluminum sulfate	640
Zinc chlorid (much used in hospitals)	526
Carbolic acid	333
Boracic acid	143
Ferrous sulfate (copperas)	90
Magnesium chlorid (bittern)	104
Calcium chlorid	25
Sodium chlorid (common salt)	6

It must be understood that these figures are merely relative and are not the same for all kinds of bacteria. Mr. Bioletti's experiments were made with respect to the common atmospheric germs, such as we have largely to deal with in sewage.

Aluminum Salts.—It will be observed that of the saline mineral substances named above, *aluminum chlorid* and aluminum sulfate stand highest; and fortunately these compounds are easily accessible in general commerce, though not at present in the San Francisco market. The sulfate can be delivered at San Francisco at about three cents a pound from the East, but can easily be manufactured on this coast. The sulfate can practically be transformed into the more efficacious chlorid by simple intermixture with common salt, using about equal amounts of each. Sea salt is preferable on account of its contents of bittern or magnesium chlorid; and *sea water can be made into a very effective antiseptic* by the addition of three pounds of aluminum sulfate to every ten gallons. This makes an excellent solution for the dripping apparatus for urinals and washstands that has found some acceptance, and it is vastly cheaper as well as many times more effective than the high-priced solutions usually recommended with which it has been experimentally compared.

Colorless, Inodorous and Non-poisonous.—A solution made by dissolving 3½ pounds of aluminum sulfate and an equal amount of common salt in 10 gallons of water is now in use at the University with excellent result.

It is found that it would take 120 pounds of aluminum sulfate to render 1000 gallons of average sewage completely sterile; but less than half that amount will prevent the formation of sewer gas, and the cost of thus deodorizing closets andurinals is almost nominal.

This "colorless, inodorous and non-poisonous" solution should be in abundant supply in all hospitals, soldiers' quarters and public institutions; and can readily be used in private houses as well, without danger of accidents. It can also be used as an astringent antiseptic wash for wounds.

Mining Summary.

CALIFORNIA.

Amador.

The Griesbach mine in Volcano district has about 200 tons of rock ready for the crusher.

This week at a Probate Court sale in San Francisco 5000 shares of the capital stock of the Kennedy M. & M. Co. of Amador county were sold at the rate of $8.73 per share to B. Doe.

Record: At the Potazuba mine, Sutter Creek, the ledge in the north drift at the 500 level has widened to 12 feet. On this lode it is estimated that a low-grade vein has to carry about 15 feet of ore in order to pay, and the Potazuba promises to exceed this size. Supt. J. Ross, Jr., of the Wildman-Mahoney, has charge of the work at the Potazuba.——J. H. Wise of San Francisco has purchased an interest in the Amelia Co, Jackson. The shaft is down 610 feet and sinking is progressing. It is intended to sink 1000 feet before drifting.

Butte.

The Boulder gravel mine, near Nimshew, is in operation.——Work continues successfully at the Black Leg mine.——The Silva Co. at Cherokee has finished cleaning the tunnel and is preparing for another run.

Calaveras.

P. L. Shuman of Chicago purchased the Empire gravel mine near San Andreas, containing 79.7 acres, for $4000.

The Rose Hill mine at El Dorado is opened again by the new company who bought it from the Rodesino estate. It is understood they will build a new stamp mill, as the old one proved a failure. Men are working the mine.——Work at the Live Oak mine is in progress. Ore recently taken out assayed from $30 to $150 to the ton. The ledge is 4 feet wide. The owners may put up a new mill as soon as a sufficient amount of pay ore is at hand.——The Maine mine, formerly known as the Tindall, has been prospected with favorable results. The ledge is being developed and good ore was struck which shows plenty of sulphurets. The rock goes from $10 to $100 to the ton.

Work is being done in the lower tunnel of the Washington mine, near Murphys, to determine the value of the quartz at depth. Rich quartz has been extracted. Some shipped to the Selby Smelting Works ran as high as $700 a ton. A Colorado company has a bond on the mine.——The De Lay tunnel operations are conducted day and night with good progress.——A 2-foot vein was struck in the tunnel of the Fricot mine at Esmeralda.——The San Francisco company that bonded the Bald Hill mine, near Albany Flat, have unwatered it and are engaged in stoping the ore, which proves to be of good grade.

Del Norte.

Record: At Crescent City the shares of the Union copper mine, advertised as delinquent, were sold at public sale by Sheriff Bailey. They were bid in by J. A. Johnson in the name of the U. C. M. Co. for the amount of the indebtedness, $1365.50.

El Dorado.

(Special Correspondence).—The Limpensel mine, being developed under bond by Diamond & Gehricke of San Francisco, has struck a valuable ore body in a crosscut on the 200 level. This is another of the properties in this vicinity that was surface worked for pockets in years agone, but present practical development is showing good results. This mine is but fifteen minutes walk from the courthouse. It has good water facilities.

The Gentle Annie mine is taking out good ore from the 400 level. The sulphurets are of good percentage and fair value. The cyanide plant at this property is about completed.

Work at the Griffith Con. Co.'s property, near Diamond Springs, is making favorable headway. Grading for the new 20-stamp mill, the installation of the 100 H. P. electric plant, and the development of the mine, are apace with vigor and enterprise.

At Grizzly Flat, the Eagle King 10-stamp mill is running on good ore from this property, which is improving with deeper workings.

The Sutherland 10-stamp mill is crushing a good quality of cement gravel. The holdings of this company cover a mile of channel.

The Crown Point and Lone Star mine, two miles south of Diamond, is rushing work in both shaft and tunnel. The company, Scotch capitalists, closely allied, it is said, to the Jumper of Tuolumne and the Griffith Con. of this county, is systematic and enterprising in the development of these properties.

The Boulder mine, near Shingle Springs, is proving an excellent dividend payer as work progresses, though in the early stage of its resumed development, after a lapse of years, the present operators had concluded to cease further work but were otherwise persuaded by their sanguine Supt.

The Hall Con.—cutting its way by a long tunnel through the Mierson Con. group, which had been abandoned by is former operator at 450 feet—is showing good results as work progresses. The property adjoins the Gentle Annie and is on the lode and in close proximity to the Skinner and Limpensel properties, which are both proving a success. A crosscut at 470 feet in the tunnel shows a 30-foot wide vein, of which 15 feet wide averages $8.45 by mill test. There is in this a streak that runs in kidney shape of from 1 to 12 inches of specimen ore. The tunnel cuts the footwall vein at 300 feet depth. The north drift is 220 feet, of which 100 feet are in ore.

The Big Sandy and Sunrise at Kelsey are running ten stamps each on a good ore product.

The Esperanza at Garden Valley is credited with a good output of fair grade ore.

The sale of the Taylor mine has not been accredited thus far in Placerville, though it is definitely known that work in the property has ceased.

Placerville, June 13th, '98.

Kern.

The Napoleon mine, at Randsburg, has reached a depth of 170 feet. From twenty tons of ore milled they received $2000. Over $28,000 have been taken the past year.——The Ophir mill at Cuddeback lake made a run of two and a half tons of ore from the Santa Ana mine, which turned out $140.——The Eureka mill, Randsburg, two stamps, has turned out more than $13,000 in bullion the past month.

In the Badger mine, at Rademacher, at 150 feet depth the ledge is 6 feet wide and assays about $25 to the ton.——The Yellow Aster Co. expect to use ten stamps at the Red Dog mill and fifty stamps at Barstow.——The Black Hawk mine, midway between Randsburg and St. Elmo, will ship eight carloads of ore.

Madera.

(Special Correspondence).—The machinery at the Lily mill is being overhauled and improved preparatory to starting up when the pipe line is completed, which will now be at an early date.——Messrs. Peters & Hanshew have removed their 3-stamp mill from the Keating mine to Fine Gold creek, one and one-half miles from the mine.——Four men are working at the Gambetta. The upraise in the Last Chance is within 20 feet of the old winze, which is to be tapped.——A concentrator will be added at an early date to the 5-stamp prospecting mill at the Starbuck mine.——Leroy F. Mitchell has opened up the Magnet lode on the Yankee Boy location and has found the characteristic features of talcose slate with veins of quartz carrying sulphurets and some free gold. At the Safe Deposit location, on the same lode, there is now fifteen tons of ore on the dump, much of it showing coarse free gold and all of it heavily sulphuretted.

Gold, June 14th, '98.

Nevada.

The Phœnix M. Co., operating the old Sneath & Clay mine, which had been abandoned for several years, have come into an ore body of good value.——The claims owned by the North Star M. Co. at Grass Valley produced $319,234.41 during 1897, of which $281,099.48 was the yield of the Stockbridge mine; the remaining $38,134 98 was the product of the old North Star mine. The net addition to the cash resources from the operations during 1897 was $107,020.85; cash on hand January 1, 1898, $179,617.70. During the first three months of 1898 the value produced from the Stockbridge has amounted to over $102,000, with a realized profit of about $40,000 to $45,000. The company's available cash resources amount to more than $250,000. The bullion production of the North Star M. Co. from the date of its incorporation in 1884 to January 1, 1898, has amounted to $2,839,148.91.——A meeting of the stockholders of the Delhi M. Co. will be held at the San Francisco office next Thursday to consider the expediency of a voluntary dissolution of the corporation.

The Blue Bell G. M. Co., located near Washington, has filed a suit in the U. S. Circuit Court for an injunction restraining the South Yuba Water Co. from using a flume which the defendant has run from a point on Fall creek. The Blue Bell people claim a prior filing on 500 miners' inches.

Work has been resumed on the McKinley mine near Moor's Flat.——The Buck Bros., Moor's Flat, it is said, contemplate building a 5-stamp mill.——A vein of good ore has been struck in the Sleeping Beauty mine near Columbia Hill.

Union: In a few days the hoist and pumping plant at the Omaha mine will be run by electricity, applied direct. This is the first application of electricity used in this way in the district, and success is watched by other companies who are thinking of using electricity. Supt. Mainhart is very conservative in speaking about the Omaha, but says it shows considerable improvement.

Transcript: Nibell & Co., who have an option on the National Pride quartz mine near Graniteville, are making good headway with their prospecting operations.——The Delaware drift mine on the Harmony ridge at Nevada City is about worked out. It has for a long time been operated to a profit by R. McMurray & Co., the owners, but labor will soon be suspended there, as that portion of the channel lying within the boundaries of the location is about exhausted.

Placer.

Work has resumed in the May Flower mine, Forest City.

Leader: J. A. Bank and two sons are taking out $15 rock at the Big Pine mine, near Auburn. They have taken out 125 tons, 50 tons of which have been milled and gave good returns.

Plumas.

San Francisco people are examining the Green Mountain group of mines at Crescent with a view to resuming work.

The Plumas Eureka is not operating, and it is generally understood that the owners will not resume work.

The hydraulic mines about Johnsville, owing to the dry season, have not produced the usual amount of gold.——Work at the Four Hills mine is progressing.

Rogers & Co., working a drift mine near Quincy, took out a nugget weighing $1200.

Bulletin: At the Jamison mine near Johnsville twenty stamps are running on profitable ore. Over thirty men are employed and operations proceed upon a systematic basis. Sam W. Cheyney is Supt.

San Diego.

H. H. Douglas, representing Eastern people, has secured a working bond on the Bay Horse mine, situated in Mesquite district, near Hedges. Crosscutting and drifting on the 115-foot level is in progress. There are three shafts on the mine, which, together with surface cuts, show an ore body 90 feet wide, 600 feet long and 115 feet deep. The new company will pump water from the Colorado river through eighteen miles of pipe and erect a 20-stamp mill. They expect to be milling ore by December 1st. There are other mines in the district which will be worked after the pumping plant is established.——The Golden Dream Con. M. Co. has sold to the South Jersey D. Co. the Golden Dream group, Oro Blanco group, Noonday group, Capella group, Pleiades group of mines, and the Emilio and Gold King mill sites.

Receiver C. W. Pauly of the Golden Cross M Co. at Hedges has filed his sixth report. He cleaned up $45,018 61 in gold bullion as the result of the April run. During the same month he received $1428 60 from other sources, making the total receipts for April $46,447.21. He has paid since out $42,323 06 for the company, which included $11,500 paid to creditors, and on April 30th had $55,941.02 on deposit. The cash to be paid on April claims amounts to $21,500.

A strike of petroleum is reported near Encinitas on the property of P. Lux, who was boring for water. When down 150 feet a vein of coal was encountered, which, when pierced, gave out a good flow of oil.

Shasta.

The prospecting of the copper property on Stillwater by the New York company, W. Kemp, Supt., has progressed favorably. Several prospect shafts are being sunk, and in one shaft there is high-grade ore sufficient to warrant sinking as soon as the inflow of water can be handled.——A shipment of ore from the Washington mine, near French Gulch, taken out by leasers, was sent to the smelter.——Three and a half tons of ore w brought last week from the Bremer & McManus mine, near Carrville, and shipped to smelter.——A company of capitalists from Tacoma, Washington, purchased the Deming mines, near French Gulch. They have been incorporated under the laws of the State of Washington.

Sierra.

The Bojorques mine, near Downieville, looks well in the face of the tunnel, in 100 feet. The ledge is from 2 to 5 feet wide and the ore runs from $10 to $15 per ton. There are 200 tons of rock on the dump.——The ledge has been struck in the lower level of the Plumbago mine with favorable indications.

Siskiyou.

The Mississippi is the only mine running at Seiad. Two giants are in operation the year round. It is paying well.——Work on the new wingdam near Hamburg Bar is progressing.——D. W. Jones last week brought to Fort Jones 107 ounces of fine gold, the result of three days' run of his mill in Quartz valley.

Work in the Pacific mine at Humbug, Klamath river, is progressing despite the trouble in setting the cribs, owing to quicksand.——At the Quinne & McConnell claim, Klamath river, the top ground will soon be cleared, when day and night work is to be commenced.——The Slide mine, at South Fork of Scott river, has been put in order for successful working by A. Bouvier.——The water supply is holding out well in the Oro Fino section of Scott valley. The Eastlick and Wright mines, under the superintendence of O. S. Rusby, are worked with good success. Gardener, who also works in the same vicinity, is keeping his giants in operation with a good supply of water.

News: The Uncle Sam mine near Yreka will be unwatered and development resumed.——The Neversweat mine is in operation with a full force.——The Glendora quartz mine is producing ore that nets $7 per ton.——The Mountain Bell mine in Humbug district is working on a 30-inch ledge of $15 rock.——Work will be resumed shortly on the North Star mine.——The Deer Lodge mine in Humbug is operating on an 18-inch ledge of $12 ore.——The Boyle mine has forty tons of ore on the dump, of good grade.

Trinity.

In the Boulder mine, near Cinnabar, a ledge has been cut that has 2 feet of quartz that yields a good prospect, and 6 or 8 feet more that is heavy in sulphurets and carries a good per cent of copper.

Tuolumne.

Democrat: In the Gagnere, Sonora, a new ore chute was developed. Two assays gave $450 and $437 respectively. The force was increased and the drifts rushed farther south. The ore body is now from 7 to 20 feet wide, and indicates one of the most valuable developments in the county.——Davis & Starkweather have temporarily discontinued work on the Osceola. The vein was tapped by a crosscut tunnel after driving 40 feet, and then drifted on 121 feet more. The rock mills $75 per ton, but the ledge is small.——In the Carlotta and Pennsylvania mines, both owned and operated by the same company, work is confined to drifting on the 200 levels. The vein in both mines is from 14 to 30 inches wide. The ore, especially in the Carlotta, is high grade. Supt. Neagle has not decided when he will resume sinking, probably not until the contemplated mill is completed.

Magnet: Work has been commenced on the 2000-foot shaft on the Jumper near Stent.——The Bonanza mine near Sonora has reached a depth of 1800 feet on the incline. There are from five to ten tons of high grade ore on the dump.

Tulare.

Sorrels & Russell will erect a 2-stamp mill on the Vulture mine, near Porterville. There are 100 tons of ore on the dump.

Yuba.

Democrat: There is no underground work being done in the mines of the Webb Co. and no indication of work being resumed.

NEVADA.

The Chainman mine and mill, near White Pine, were shut down temporarily for repairs to the pumps and to make a test run of 150 tons of ore from the Jupiter mine.——Steam wagons are to be put in use from the Eyrie mines in Tuscarora, such as are used at the De Lamar mines. From these mines ores of the value of $200,000 were marketed at Salt Lake valley smelters before the present owners acquired possession. The original owners extracted only such ore as was of a very high grade. Nothing that did not afford more than $100 was broken down. The result was that a large amount of low-grade ore was left standing. Much of this shows a valuation of $90 per ton. To market this it is necessary to pay $10 a ton for a haul of fifty-two miles from the mine to Elko, where a connection is made with the railroad.——At the North Mountain mine, Cherry creek, the crushers that were started up recently are handling fifty tons a day of a class of ore that affords a good margin, and this tonnage is to be increased.——The borax teams arrived at Winnemucca from Oregon with 36,000 pounds of borax.——Copper ore is being hauled to Wells from the Salmon river country nearly every day and shipped west.——H. W. Ely took to the Carson mint a bar of bullion from ore from the Mayflower mine, in Como, which was obtained from eleven tons of ore worked at the Wilson arrastra, and gave returns of $55 per ton.

The May payrolls for the Comstock foot up to $53,955, about $3000 less than for the month of April.——The De Lamar *Lode* says that an ore body 100 feet wide has been discovered in the April Fool mine.

OREGON.

Baker City *Democrat*: The mines of the John Day were never more productive than this season. There is plenty of snow, and, therefore, plenty of water. Within one and a half miles of Susanville there is still 6 feet of snow on the mountains. Mines are running in full force on California gulch and Happy Camp and are paying good profits. Some nuggets taken out of California gulch go from $5 to $8, and some taken out on Vinson creek go $8.

WASHINGTON.

Rich ore continues to be shipped from the Republic mine to the smelter.——The tunnel on the Jim Blaine at Republic is being driven at the rate of 40 feet a week. The tunnel is in 300 feet.——In the San Poil the ore runs as high as $80 per ton.

The final payment on the Golden Harvest group of claims in Eureka district, which was bonded by J. M. Burke and associates, has been made. This completes the payment of the purchase price of the property, which is said to have been $20,000. Recent reports from the group are to the effect that development is daily adding to the value of the property. The ledge is said to be large.——The Butte & Boston has a pay chute that is over 100 feet long and samples over $20 per ton.

BRITISH COLUMBIA.

A Rossland report says the Le Roi deal remains unchanged. The company at its statutory meeting to act upon the offer of the British America Corporation to purchase the mine for $3,000,000, adjourned until June 27th, when the stockholders will again get together. The de'ay arose over the trusteeship of the pooled Le Roi stock, which includes 427,000 shares out of the total 500,000 shares. The pool was entered into about eighteen months ago when different factions of the company got together to the extent of 427,000 shares which were placed in an iron-clad pool for ten years, under the trusteeship of Turners and Peyton.

In the upper tunnel of the Emily Edith, Slocan, a body of ore was cut 3 feet wide, 1 foot of which is clean shipping ore.——A new strike has been made on the Fidelity. It is said the ore will average over 100 ounces silver and 50 per cent lead.——Five inches of clean ore has been struck on the Mountain Lily, one of the Roulette group.

The final payment of $27,000 on the B. C. mine in Summit camp has been made by A. H. Harrison, representing the purchasers, to John W. Keogh & Sons. The purchase price was $60,000. Since the bond was taken, about a year ago, almost 700 feet of work has been done and 1200 tons of high grade copper ore is on the dump.——Dalrymple & Carmichael, the owners of the Flora group in Fairview camp, have bonded the property to Ritchie & Stewart for $15,000.

The Whitewater Deep is taking out ore and expects to begin shipping shortly.

Mackenzie & Mann recently bonded the Big Patch group near Ymir for $45,000 for 30 days. Darrow & French, the owners, retain a one-fifth interest in the property. Considerable development work has been done on the property, which shows up a ledge 4 feet wide of good ore. Mackenzie & Mann will develop the property as rapidly as passible.——In the Van Anda mine on Texada island a strong chute of ore has been struck. The vein matter is about 12 feet wide, nearly 6 feet of which is showing the bornite copper ore characteristic of this property. The work of crosscutting at this point is not yet finished.

On Anderson lake, Vancouver island, development work is progressing on the properties owned by the B. C. Gold Co. The croppings on these claims are from 30 to 60 feet wide and can be traced for a long distance.——On Alberni canal several copper claims are being opened near Namint bay. On one of these is a showing of good vein matter about 10 feet wide containing copper ore of shipping value.——At Sydney Inlet, in the Clayoquot district, a large amount of development work is being done on copper claims. Much of the ore in this section is a mixture of bornite and chalcopyrite and contains gold.

On the Fidelity property, Slocan, the ore chute has been uncovered. Work is being pushed on the tunnel.

Kootenaian: Four feet of ore has been discovered under what was supposed to be a footwall in the Whitewater mine near Kaiso. The accepted footwall proved to be only a foot of spathic iron.——A. B. Irwin, Mgr. of the Canadian Pacific Expl., says his company will build a 10-stamp mill and a five drill compressor on the Porto Rico near Ymir. An aerial tramway of 2500 feet is to be constructed to carry the ore from the mine to the mill. The ledge, which has been opened at three levels by tunnels, is producing good concentrating ore.——Work is being pushed on the Gold Queen and Mulligan claims near

Ymir. The lead on the Gold Queen can be traced for 1000 yards and is 5 feet wide. The pay streak, which is now about 9 inches wide, is getting wider as work advances.

ALASKA.

Alaska *Miner*: On Prince William sound, near Fort Fidalgo, a company known as the Prince William Sound M. & D. Co. is conducting mining explorations and developments. This company has a capital of $600,000. Ex-Marshal L. L. Williams is Pres.

At King Solomon's Basin, on the main creek, are thirteen claims which will be worked hydraulically. Each claim contains twenty acres. The company has also a quartz mine on tide water which has not yet been opened up. The placer property is advantageously situated for economical working, being only one mile from the harbor. A tunnel will be driven this summer to drain the claims.

The Copper Mountain M. Co. has been organized to work properties at Fort Fidalgo. The company has a copper ledge which at a point five miles from the beach is 75 feet wide and it comes twice to the surface between these two places. At the beach the ledge shows up 500 feet above the water. Development work on this property will continue all summer.——The Pande Basin Gold Placer Co., with a capital stock of $2,500,000, has been formed, with M. L. Muhleman, cashier of the Sub-Treasury, New York, as Pres.

UTAH.

The Congor mine at Bingham reports the presence of ore showing 21 per cent copper, seventeen ounces silver and $4 50 in gold. Of this class of ore there are 14 inches in a vein that is 9 feet wide, and from which several shipments have already been made, the last lot showing as much as 22 per cent copper. In addition to that which is now being shipped there are several feet of second-class ore that would yield good margins in a concentrate. Meanwhile development work is being done on the ground and it is not unlikely that concentration of the second-class will be provided for before the end of the year.——The Keystone, in Pine guich, in West Mountain mining district, is marketing 200 tons of ore under the Elmer Hill lease, and the property is in good condition. The ores carry copper, silver and lead.——The Julia Dean is handling its second-class ores through the Heaston jigs at Bingham, which give the owners a product of the value of about $35 a ton.

The shaft on the Martha Washington at Silver City is to be put down an additional 200 feet before further prospecting is undertaken, although the management will continue to break down and make periodical shipments of a class of ore that affords good margins. The putting down of the shaft 200 feet farther will carry it to a depth of 500 feet, and at that point crosscutting to the vein will commence.——E. G. Heffron, prospecting the South Daisy group on the West Dip, says that experiments show that a ton of ore in that locality can be cyanided at an outlay of 20 cents for the chemical, and that the ore can be extracted, crushed and placed in the tanks at a cost of 75 cents, or a total of 95 cents per ton for leaching.——Bingham representatives of Captain De Lamar are devoting sixteen hours a day to experiments on the ores from ground recently tied up by them in the Giant Chief mill. Samples show the presence of a copper pyrite in the porphyry.——Near Marysvale a vein has been found in the Eagle mine which is 2½ feet wide. A pay streak from 8 to 10 inches wide has been struck which carries a high grade tellurium gold ore. The lowest assay runs $28 gold and twenty-four ounces silver.

Tribune: The monthly dividend of the Mercur mine has been reduced from $36,000 to $25,000. This action is not looked upon as any confession of weakness on the part of the mine, but simply the enforcement of a policy to which it was known the company would return as soon as the $237,000 derived from the sale of the Resolute fraction to Capt. De Lamar was divided among those entitled to it.——The last shipment of cyanides from the Geyser-Marion at Mercur amounted to $6182.——There are nine mills in the Mercur district—the Golden Gate, Mercur, Sunshine, Sacramento, Northern Light, Chloride Point, La Cigale, and two on the Geyser-Marion. More are in contemplation.——The Grand Central mine at Mammoth shipped a trainload of high-grade ore to the smelter.——The Sacramento at Mercur made a shipment of auro-cyanides, the value of which is about $8500.——Fifty men are working at the Uncle Sam at Eureka. The main shaft is down 600 feet. Between the 200 and 300 levels a 4-foot body of lead carbonates has been followed a distance of 125 feet, and about twenty-five tons a day are being shipped. Assays from this ore show a value of 60 per cent lead and forty to fifty ounces in silver.——The Last Chance mine at Bingham made a new strike on the 500-foot level of a 2-foot wide vein that has an 8-inch filling of galena and the balance carbonate. From the galena an assay was obtained showing 41 per cent lead and 123 ounces silver, while the carbonate showed 8 per cent lead and seventy-three ounces silver.——The Marsac mill at Park City is running an average of eighty tons of Ontario tailings every twenty-four hours.——About fifty-five tons of ore is brought down on the Crescent tramway each day, and there are five lots down ready for shipment. Before the ores which are already hoisted from the workings are all brought down the total will reach nearly 4000 tons, and this will require over two months to move. The ore runs high in zinc and lead. Over 300 tons of ore have been shipped by the Ontario Co. within the past two weeks, and yet the men employed are only doing prospecting work.——The Tintic *Miner* reports the shipment of eighty-five cars of ore, ten cars of concentrates and twenty-seven bars of bullion.

Mercur *Miner*: The Tioga Co. has purchased the Susquehannah claim, adjoining the Tioga group. There are thirteen claims in the Tioga group and they are in the mineral belt embraced in the Chloride Point and Hercules properties. Three hundred feet of work has been done on the Tioga group and 100 feet on the Susquehannah, and a good showing has been made. Values ranging from $1.64 to $7.20 have been uncovered.——The Hercules mine at Stockton marketed a shipment of ore which showed 53 per cent lead and seventeen ounces silver per ton.——The Washington mine of Frisco marketed a lot of ore showing 60 per cent lead, 135 ounces silver and $12 in gold per ton.

Tribune: Mining men claiming to be conversant with the ore bodies that have been blocked out in the Resolute fraction since its acquisition by Captain De Lamar, say that at $237,500, which was paid the Mercur, the actual cost represents about 50 cents a ton, including the work of development. It is known that since the purchase of the strip, which consisted of less than seven acres of ground, Supt. Duncan has been actively prospecting it, and that already two chutes of ore, if not a third, have been encountered. It is said that in one place the ore body is nearly 40 feet and that the values are equal to any that have been encountered in Mercur ground.——The ore bodies in the Columbia at Lion Hill are improving, and the management promises to add it to the list of shippers shortly.

IDAHO.

Excavation for the Poorman mill at Florence is nearly completed and it is probable that the stamps will be dropping on ore by July 5th.——In the Nancy Hanks 2 feet of chlcride ore has been found which assays 400 ounces silver and $12 gold.——The Lake Creek Placer Co., operating near Warm Springs, is reported to be working day and night with men.——The cyanide works at the Camas No. 2 mine are in operation. They are, however, doing 50 per cent better than last year. Last year the tailings put through was about thirty tons per day, but the quantity now is between forty-five and fifty tons. It will be increased to sixty tons per day, and in the warm season to seventy-five tons.——A carload of North Star ore was shipped from Picabo last week.——Bradley & Halterman bought the Franklin and Vixie mines at Pine Grove for $20,000. It is their intention to start development work on an extensive scale immediately.——The dredge of the Basic Co. at Placerville has been launched. It is 40 by 100 feet. The placing of the machinery in position will begin immediately.——J. C. Dougherty of Challis writes that uranium ores have been found there.

Gov. Tanner of Illinois; J. W. Gates, Pres. Illinois Steel Works, Chicago; W. Palmer, Vice-Pres. of that company; J. A. Drake, Treas. Illinois & Indiana Railway; and T. S. Woods, a Colorado mining man, made a visit to Warren mining camp, where they purchased the Iola mine. A 10-stamp mill is being erected at the mine. They report that a 30-inch ledge of rich ore is at a depth of 200 feet.——The plant of the Idaho Antimony M. Co. is to be enlarged, the process having proven successful. The plant was experimental. The first lot of crude antimony was shipped to the refinery in New Jersey. It has been demonstrated that the flower of antimony can be extracted from the ore.——The shaft and drifts in the Jupiter mine, near Idaho City, have been cleaned out. There is $2500 worth of ore on the dump.——The Blue Bird is making a good showing. It has a vein 15 inches wide of ore that will mill $150 per ton. The mine was worked over thirty years ago and abandoned. It remained idle until two years ago.

Mt. Home *Republican*: The Shields mining property at Rocky Bar has been sold to Denver parties. It is the intention of the company to expend $100,000 in development work, beginning this fall. The Shields mine is considered one of the best in the district. A mill run of forty-one tons averaged from $60 to $65 a ton.

World: Five teams, eight and ten-horse, pulled through Idaho City last week loaded with machinery for the dredge at Placerville. One piece, a revolving grizzly, weighs 8950 pounds. The dredge will be run by a 500 H. P. dynamo, which will be placed on Grimes creek. The foundation for the dynamo weighs 20,000 pounds.

The *Tribune* of Wallace reports the bonding of the Flynn group of claims in the Cœur d'Alene district for $250,000. Sixteen claims are embraced in the deal. They extend for more than a mile and a half from the Black Bear mine towards Mullen. Practically no development work has been done. Four per cent of the price fixed in the bond is to be paid at once, 46 per cent in sixty days and the balance in a year.

Avalanche: The test run of fifty tons of Poorman ore, Owyhee, was highly satisfactory to the Mgr. The plant is now running at its fullest capacity, ten tons daily, and is said to be saving the values very closely.——The Empire mine will be cleared to the fourth level and the drifts extended. The long idleness at this property necessitates overhauling of machinery and replacing of timbers, but the work is progressing rapidly and mining operations will soon commence.——At the Cumberland the mill is running steadily and bullion shipments are regular.

MONTANA.

The Hope mine at Basin has been temporarily closed, to be started up again when the company gets ready to carry development work ahead. The lead was cut at the 400-foot level, where the ore proved to be richer than that found on the 300 level.——The Buffalo mine at Rochester is working eight men.——The Bertenia mine at Rochester has about 400 tons of silver ore out ready to be treated.——The old Watseka mine, Twin Bridges, is being worked by a number of leasers who ship a carload of $60 ore a week to the smelter.——In the Thistle M. Co., near Rochester, since May 1st, the output has been ten tons weekly of first-class shipping ore. The development work of the past few months has demonstrated the continuation of the rich ore body. The first-class ore is shipped and the second-class is treated in a cyanide and concentrating mill.——The Elgin mine, near Rochester, employs fifteen men. An ore body running from $20 to $30 has been opened up, and the product is about ten tons daily.

Thomas & Heath have given a bond and lease of the Howard, near Helena, to H. A. St. Earl for $10,000, and the lease on a royalty of 35 per cent. Some rich ore has been taken from the Howard; there is a vein of 14 inches, some of which has been tested and found to be worth from $350 to $400.—— Precipitates weighing 4586 pounds were shipped from the cyanide plant at Marysville. They are valued at $32,200, and form the May run.——The Clark's Fork gold dredging boat, near Red Lodge, is ready for work. The suction dredge has been replaced with a dipper apparatus, the machinery improved and the sluice boxes placed upon a scow behind the boat. A trial run was satisfactory.——It is estimated, says the Philipsburg *Mail*, that there are at least eighty men employed by the Con. Granite-Bimetallic Co. in Granite alone, and it is also claimed that inside of two or three weeks the force will be augmented. Report has it that the company is running a drift from the 1000-foot level of the Bimetallic, which will tap the Granite shaft at about the 1350-foot level. They have been working on this drift for over a month, and it is claimed that a couple of weeks more will make the connection.——The Montana Ore Purchasing Co. is doing development work on the Parnell, the Nippur and the Cora claims—all in the center of the rich copper belt of Butte and surrounded by some of the heaviest producers in the camp. The Anaconda Co. is installing the new engine in place of the old one, which has been in use at the Anaconda mine since 1882. The Original Stewart and Colusa-Parrot mines of W. A. Clark are all producing the regular output of ore.

At Pony sixty-five stamps are dropping and every leaser in the camp is making money. At the Mayflower, original location, eleven men are taking out ore. At Mayflower No. 3 eighteen men are at work. It is said that in this mine there are 12 feet of $100 ore in sight.——The first carload of ore from the Snow Shoe at Libby, for the season, was shipped last week. A big force of teams is on and the ore will come in with a rush the rest of the year. The output will be greater than last season. In the vicinity of 400 tons of concentrates are ready for transportation, and more than 1000 tons of ore are broken and ready for the mill.——A find of rich ore is reported from the Little Lottie claim, near Clancy.——The Townsend *Messenger* says that interest in the old Greyson creek leads is revived and men are extracting ore for shipment.

Intermountain: The Mayflower mine, near Whitehall—a remarkable gold producer for the amount of development work done on it—is looking well at a depth of 480 feet. The ore body has been nearly lost once or twice after hundreds of thousands of dollars had been taken out in high-grade gold ore, but with further developments it was again caught and the theory that the mine was a big surface pocket and did not go down has been long since abandoned. The mine is owned mainly by W. A. Clark, who purchased it from the original owners with two other adjoining claims for $150,000. The ore is of such a nature that no prospector ever thought it had any possible value and the place has been tramped over for years past. The three young men who owned the claim had already taken $60,000 from the mine when Mr. Clark made the offer of $150,000 for it. Many times that amount in gold has been taken from the mine since that time, however, and the workings nearly 500 feet down from the surface show a good continuous ore body.——With the Parrot Co. the Little Minah shaft is still sinking, all other work for the present being abandoned.——At the meeting of the Parrot S. & C. M. Co. the work of Gen. Mgr. R. D. Grant in opening up and developing new properties was endorsed. Development work will be resumed on several properties. Work is now in progress at the Bellona and Little Minah. In a few weeks work will be commenced on the Moscow, Oro Butte, Autocrat and Banker, near the Poulin property. The smelter at Parrot will not be operated this year, but Mgr. Grant was instructed to complete the improvements under way. Mgr. Grant's report for the eleven months ending April 30th was submitted. Dividends amounting to $281,841.25 were paid during the year, leaving a surplus of $1,620,998.24.

SOUTH DAKOTA.

In the Gold Coin shaft in the Dansby district, near Custer, a 9-foot vein of payable ore is being explored and the erection of a mill to treat the ore is contemplated. Upon the Lizzie group operations are continued with good results. The shaft has reached 150 feet and the ore carries good values.

COLORADO.

CHAFFEE COUNTY.

The Mayflower group in the Badger section has a 100-foot shaft in which is a 4-foot vein of hematite and amethystine quartz carrying about $35 in gold value. The shaft will be sunk to a greater depth before any extensive drifting is done.

CLEAR CREEK COUNTY.

Leasers at the Toledo mine, Idaho Springs, are getting out a shipment of smelting ore that will run $125 per ton for the carload They are also moving a second-class ore that nets $50 per ton.

EAGLE COUNTY.

A shipment by lessees on a Battle mountain property of 13,583 pounds of ore, ran 141.85 ounces of gold, 118.2 ounces of silver and 10 per cent iron excess. The royalty amounted to $4700 and after paying that amount and all other charges, the lessees received $19,173.23 as their profit.

EL PASO COUNTY.

The April report of the Isabella Co. has been made public. They shipped 1038 tons, which returned $25,087.45 net. The mine expenses were $14,817.89 and the sum of $9493.78 was paid lessees and part owners of the Comet claim. Office expenses were $389 35, leaving $377.43 net profit for the month. On May 1st the treasury reserve was $103,676 47.——Since May 1st the Uintah tunnel, Victor, has run 230 feet and cut six veins of low-grade gold ore. They expect in the next ten days to cut the Uintah vein opened in the Necessity. They have during that time shipped 100 tons of medium grade ore. Rapid progress is being made with development work.——McCormack & Co., who are operating the block of ground known as the Linday, under lease and bond from Bennett & Myers, are shipping about a car of two-ounce ore every day.——The Moon-Anchor, Cripple Creek, is keeping up an output of about 150 tons weekly of ore worth $60 per ton. The latest shipment—seventy tons—ran up to $90. The shaft is down 500 feet. So soon as the new machinery is completed the property will increase its development.

LAKE COUNTY.

Record: The Yak M. & M. Co., working a large acreage through the Yak tunnel, are increasing their output. Five railroad cars are sent out daily, besides considerable development work kept under way. All mining is done at a minimum expense on these workings.——The Mab mine in Graham park is driving two drifts at a depth of 1000 feet. Four shifts are working six-hour shifts in each drift. It is thought that by July 1st the ore shoot should be opened.——The Penn M. & L. Co. is operating in the Breece hill camp from two shafts, the Breece, which is 800 feet deep, and the Philadelphia. Shipments are heavy from the Philadelphia. The company has decided to erect a large cyanide plant at the Breece shaft.

LA PLATA COUNTY.

In the Last Chance mine in Silver City basin, workmen broke into an ore streak that is 16 inches wide and runs twenty ounces in gold per ton. There is a carload of this grade of ore sorted and ready to ship. Two tons a day are being taken out.——All the mines are working full capacity. After July 1 there will be two more added to the shipping list. On one of these the owners are taking out ore from a 2-inch pay streak that is said to run $1200 a ton.——The East and West Mancos placers have commenced operations.——On the Oro Fino side of this district there is much activity. The Graden M. Co. is working the Neglected group under bond and lease. From mill tests made the ore runs $23 in gold, $9 on the plates and $14 in concentrates. It concentrates eighteen into one with an 88 per cent saving, making a rich product of concentrates.——The Durango Boy and Girl make their monthly shipment of high grade ore that runs from $3 to $4 a pound. The lessees are piling up their low-grade ore, intending to sell it in bulk to the smelters. This second grade runs over two ounces gold and twenty-seven ounces silver a ton.

PITKIN COUNTY.

The Robert Bruce placers in Taylor park near Aspen have commenced work. They have three shifts at work and operate without cessation, except to clean up. They can handle from 1000 to 1500 yards of gravel a day. Their ditch, which is over four miles long, is carried over four ditches by flumes which used up 150 M. feet of lumber. It carries 2400 inches of water and at its lower end is 245 feet above the workings. From this point nearly half a mile of pipe, 2½ feet in diameter, carries the water down to a casting shaped like a V into sets of pipes 1½ feet in diameter and several hundred feet in length, and finally in still smaller pipe it arrives at the base of the gravel elevator. The power generated by the water is used to carry the gravel up and deposit it on a piece of trestle work on which there is a flume with the ordinary riffles.

Investor: The year 1898 will see the revival at Aspen of one of the best known silver mines and past dividend payers in Colorado and the development of another, which is almost equally as well known, into a condition of prosperity. The mines are those belonging to the Mollie Gibson and Argentum-Juniata companies, stock in both of which is held in large blocks in Denver and the East. In the past the Mollie Gibson has been an enormous dividend payer and over $4,000,000 was distributed among its stockholders. That was when silver was selling in the neighborhood of $1 an ounce, and when the limits of the famous ore chute were unknown. Silver is worth only about half what it was, while farther down in Mollie ground Mother Earth was so badly rent that the continuation of the ore chute has been lost for years. The Argentum-Juniata has a good record as a silver mine, but has only been a light dividend payer. It came into prominence later than did Mollie Gibson and was always looked upon more in the light of a big commercial enterprise than a bonanza. For many months past both mines have been run at a small profit, but with never enough to warrant the payment of dividends or even to guarantee a large treasury reserve. Within the past ten or twelve months a remarkable change has occurred in the ore bodies in both mines. This was more particularly noticeable in the Mollie Gibson, noted for its very rich bodies of ore in the past, which has developed into a proposition with large bodies of low-grade ore. The grade of the ore decreased also in the Argentum-Juniata, while the size of the bodies increased, but the change was not so pronounced, as the mine had not been previously such a high-grade proposition as the Mollie.

SAN JUAN COUNTY.

The Silver Wing of Silverton has a tunnel 1450 feet and will reach the Tom Moore vein in another 300 feet. Since starting the tunnel two veins of high grade ore have been crosscut, from which a number of tons of ore have been taken. Development is being pushed.——The Good Hope on Bear creek encountered

a body of ore which is a solid streak 33 inches wide that will mill run $300 per ton. The ore is fine-grained petzite and sylvanite.

SAN MIGUEL COUNTY.

The owners of the Butterfly group of mines have completed their mill and the stamps are dropping on ore from their group. The mine has a large ore reserve on hand, blocked and ready for use, besides enough already out to keep the mill going.

The Smuggler-Union tunnel near Telluride is in 1000 feet. In the distance driven and the depth gained they have never found it necessary to use any artificial means for providing fresh air. In an hour after half a dozen shots are fired the smoke has disappeared and pure air fills the tunnel.

NEW MEXICO.

At Elizabethtown three shifts are working on the Klondike sinking at the rate of 10 feet a week. But little water is encountered.——The Black Copper Co. is furnishing employment to twenty-four men.——A 100-foot shaft will be sunk on the Golconda claim immediately.——Cripple Creek capitalists have secured an option on the Challenge mine at Hematite for $65,000.——The Empire mine has 300 tons of ore on the dump. It will be crushed at the Hematite mill.

ARIZONA.

M. Hise is working his Revenue group of mines, Peeples valley, with good results. He has a large amount of ore in sight, and contemplates putting in reducing machinery.

The Wicks & Allison Gold Bonanza, near the Frisnal, continues to produce rich gold ore. The last shipment of less than one and one-half tons gave a profit of over $750 in gold.——A body of ruby silver ore has been struck in the Merrimac mine at Chloride, Mohave county.——The Monte Cristo mine at Groom creek, continues in good ore both gold and silver.——It is claimed that the ore being taken from the Nighthawk mine in Mohave county, runs 1000 ounces in gold to the ton.——The Golden Wonder mine in Tonto Basin, which has produced some of the richest free gold ever taken from a mine in the Territory, is still in very rich ore at a depth of 300 feet.——Some valuable mines are being developed on Pinto creek, near Florence, in gold, copper, silver, iron and lime flux.

The Mohave Co. *Miner* says the Colorado river is at a low stage. The chance for a June rise is not good this year, owing to a scarcity of snow in the mountains of the north.

Coconino *Sun*: That there is gold in the sands of the Colorado river in paying quantities is being demonstrated. The latest placer locations made on the river were near Lee's ferry by a company of Pennsylvania and southern California capitalists. They propose to put in machinery to save the gold, which is fine and hard to save. The company have already spent considerable money in locating and developing their placers. Last week a gasoline launch and row boat were sent out to the river and other bars on the river will be thoroughly prospected.——Springfield, Illinois, capitalists have taken the Star mine in the Bradshaw mountains, near Crowned King, and contemplate putting a mill on the property at an early date.——A 10-foot vein of lead and manganese ore has been struck in the Hardshell mine in Pima county.

MEXICO.

(Special Correspondence).—Guadalupe is an old camp, having been worked in 1848 by an English company whose old books show that $60,000,000 was taken out, the largest part gold. This amount of money was taken out off the top. The deepest shaft is only 160 feet. The present company is the Gerenti-Rosario M. & M. Co.; Sr. Don W. F. McConnel, Supt. and Gen. Mgr. The 10-stamp mill is running on the ore found in the old dumps and averages from three ounces to four ounces gold per ton. The dumps are very rich in streaks, while other parts contain but little. The vein is over 175 feet wide and is visible on the surface for over a mile. It has been worked for one-third of a mile to an average depth of 60 feet. In connection they have a plant of the Mexican Gold Recovery Co., known as the MacArthur-Forrest process, treating over fifty tons per day. The ore is stamped and runs from the batteries direct to the dump, from which it is taken to the tanks. It is treated here for $2.25 per ton over all cost, giving a neat return of $12.75 gold per ton on the average.

Guadalupe y Calvo, Estado de Chihuahua, May 27th, '98.

A correspondent of *Modern Mexico* reports tin deposits in the States of Guanajuato, San Luis Potosi and Sonora. In San Luis Potosi the granite rocks on the summit of the Sierra de la Estanero, in the mining district of Comanja, contain tin ore in abundance. In the State of Durango tin is reported which yields 35 per cent of metal, mostly in the form of oxides.

The Bufer mine, near La Dura, Sonora, is a good producer. A recent shipment of ore went about $400 to the ton and netted $1127.——In Cajon canyon, in the Altar district, the Amarillas mine is a productive property. The ledge is from 4 to 10 feet in width and the ore is free milling gold rock. Eight shafts, varying from 50 to 200 feet in depth, are on the property, with a great deal of other development work, and it is estimated that there are 40,000 tons of high-grade ore ready for stoping.

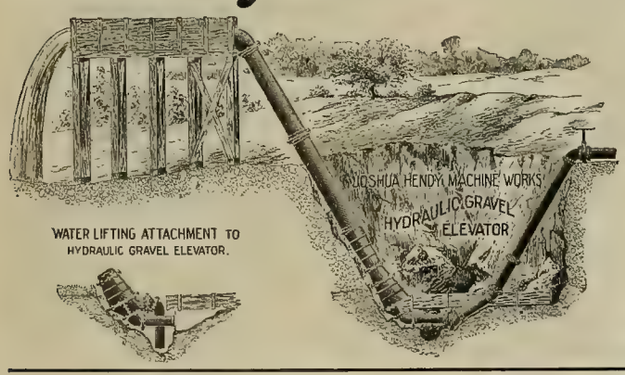
BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

Cor. 36th and Wazee Streets, DENVER, COLO.

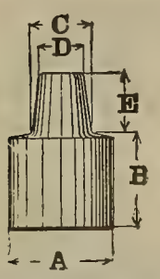
Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.



Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

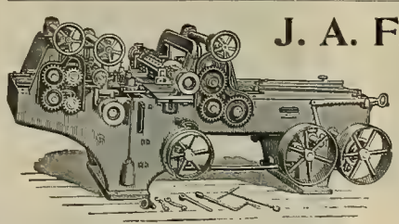
Evans Hydraulic Gravel Elevator,
— MANUFACTURED BY —
THE RISDON IRON & LOCOMOTIVE WORKS,
SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,
CONSTRUCTING ENGINEERS and MILLWRIGHTS,
Offices: 306 PINE STREET, - - - - SAN FRANCISCO, CAL.
Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.
One of these machines will take the place of two or three belt concentrators of any style and do very much better work.
SEND FOR CIRCULARS.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

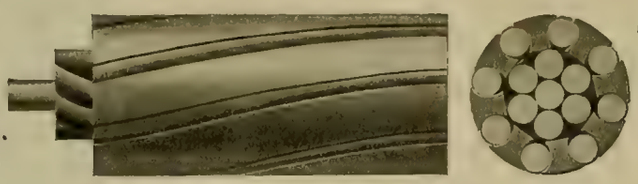
By final decision in U. S. Circuit Court of Appeals, March 3, 1898, we defeat the last claim of the Gates Iron Works on Gyrating Crushers.

MINING MACHINERY.

Be Sure You Get
THE GENUINE FRUE VANNER.
SUPERIOR TO ALL IMITATIONS.

You do not know what is best in CRUSHERS unless you have used our

Comet Adjustable.



It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

FRASER & CHALMERS, General Agents for
Improved GREEN Blowers.

See those wires -- how they interlock? Note the smooth surface also. No displacement of wires in any event. Gives three times the service of other cables, and adds correspondingly to the life of the rolling stock.

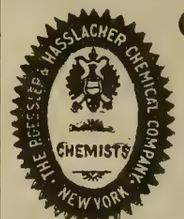
PATENTS



DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

308-312 REQUENA ST., LOS ANGELES, CAL.

Market Reports.

The Markets.

SAN FRANCISCO, June 16, 1898.

During the week silver receded from its advance of the previous week, due mainly to the stoppage of purchases by the Bank of Spain. In the London bullion market Spanish orders are not executed until the gold to pay for them is put up.

No bullion will be received for coinage at the Mint in this city after to-day until July 5th. During that interval the annual clean-up and settlement of accounts for the fiscal year will take place. A large additional force is now employed on the coinage presses, which are being rushed to accommodate the demand for coin to pay the troops.

Hemp still advances. Manila hemp is the fiber of a species of banana (*Musa textilis*) which thrives only in certain localities, where it is cultivated by the natives. The fiber is still produced in the old native way, by scraping the leaves with a peculiar knife, which requires expert handling. Numberless contrivances to supersede this simple process have been tried and patented, but without success. The native way is still the best, and it produces a fine fiber of which thread is spun and the cloth woven that excels the best Tussore silk. Manila hemp is one of the leading products of the Philippines and it represents one of the most important industries of the islands. The superior qualities of the material are well known to the seafaring men of all nations and to those connected with hempen industries everywhere. It is exported to the United States, Great Britain, Continental Europe, Japan, China and Australia. Forty-one per cent of the export trade is with the United States, the value for the year 1897 being $2,701,651.

The Frankfort Metal Co.'s comparative statistics for '97 indicate that consumption in many cases outran production, and in regard to all metals last year's consumption was in excess of '96. The copper figures show that, while the production last year amounted to 401,000 metric tons, the consumption rose to 410,000. Great Britain still heads the list of consumers, with a total of 105,263 tons, followed by the United States, Germany and France in the order named. The consumption in England, as compared with that of '96, shows an increase of 18¼ per cent, that of the United States 25½ per cent, Germany has nearly doubled, and France has more than quintupled her consumption. At the same time the average price rose from $232.50 in '96 to $245.62½ last year. While the production of tin was limited to 71,092 metric tons, the consumption rose to 75,900. In the consumption of tin the United States takes first place, with a total of 24,000 metric tons, as compared with 15,000 in England and 12,000 in Germany. The average prices for the year were $306.75, as compared with $247.50 for the previous year. Lead was produced last year to the extent of 709,400 metric tons, the largest annual output on record. The world's consumption amounted to 726,000 tons. Lead rose in price from $56.25 in '96 to $62 in '97. The production of spelter, which was equal to 443,000 metric tons, outstripped consumption by some 2000 metric tons; yet the average price in this case—$87.50—is now higher than in any year since 1892. In the spelter department Germany leads the way, with a total consumption of 119,000 metric tons, as compared with 86,000 in England and 77,000 in the United States. The most extraordinary variation of price in the metal tables is that of aluminum, which has fallen since 1855 from $112.50 per pound to 28c per pound.

Iron and Steel quotes the Chicago metal market as follows: Lead is firm at its higher level, though local demand is only moderate. Both consumer and speculator are offering 3.67½c, but 3.70c is asked, and it is reported that comparatively little can be had at that price. Users are buying only in a hand-to-mouth way. Spelter is higher and is now quoted at 4.35c in carload and 4.50 in small lots. Copper is unchanged. Lake, in carload lots, is quoted at 12¼@12½c, and 12⅝c for smaller quantities; casting, 12@12¼c for large and small lots respectively. Antimony is 10¾c for Cookson's and 9¾@10c for Hallett's in small quantities. Tin is stronger at 15¾@16c for limited shipments.

Locally spelter is quoted at $5, tin $15.10, Lake copper $11.80, lead 3.87½.

London quotes silver 26⅞d, New York 58¼c, San Francisco 58⅛c.

Miners' supplies are, in general, unchanged.

Mining Share Market.

SAN FRANCISCO, June 16, 1898.

It did not seem that stocks could go any lower, but whether it was the tax as provided in the war revenue bill or some other bearish cause, in the closing hours of last week's business they drooped lower than ever in price and volume of sales. Never before in the history of the Comstock were shares in that famous lode so low as at present, Con. Cal. & Virginia selling at 35c, a sad contrast to the days when the 540,000 shares of that famous mine were paying a monthly dividend of $2 per share.

At the regular session this morning of the S. F. Stock and Exchange Board the total sales aggregated but 750 shares—700 Gould & Curry at 12c and 50 Sierra Nevada at 58c. The official letter from the latter mine says: During the week we have stoped out from the fourth, fifth and sixth floors forty-two mining carloads of ore. The average car sample assay at the mine was: Gold, $21.55; silver, 8.32 ounces. Hauled to the Nevada mill during the week 73 tons and 1125 pounds of ore, the average battery sample assay of which was: Gold, $26.92; silver, 8.32 ounces per ton. This closes our second run, which consisted of 1285 tons and 1625 pounds of ore, the average battery sample assay of which was $54.61 per ton. Have stopped extracting ore.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Money loaned mines.

Mining companies organized, their property experted, financed and managed.

Assessment Notices.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1898, an assessment (No. 19) of three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidsdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 3d day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidsdorff street, San Francisco, Cal.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of June, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 23rd day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—No. 916 Market street, Room 57, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Room 7, fifth floor, Mills building, San Francisco, California.

CONS. ST. GOTHARD GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of June, 1898, an assessment (No. 14) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 10th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, San Francisco, Cal.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of June, 1898, an assessment (No. 10) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of July, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 8th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

Bituminous Rock Deposits in the Vicinity of San Luis Obispo, Cal.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D.

Numerous isolated descriptions have appeared of the bituminous rock deposits of California, but the geological conditions governing their occurrence, strange to say, have been almost entirely overlooked, and in the following article an attempt will be made to explain their genesis and the conditions under which they occur.

The term "bituminous rock" is commonly applied to a sandstone which has been impregnated with a thick oil or tar. In the fresh condition it forms a black and more or less plastic mass quite tough and tenacious, but on being exposed to the air for a long time it dries out and assumes a brownish color. The designation asphaltum is applied to the solid or viscous residue left upon the evaporation of the volatile constituents of a heavy oil. This may be found nearly pure where it has collected about the orifices of springs or in veins mixed with more or less sand and clay.

Bituminous sandstones are scattered at various points through the Coast Ranges, mostly in the countries of Santa Barbara, San Luis Obispo and Santa Cruz. Ventura is probably the most important oil producing county, yet the conditions here have not favored the formation of bituminous rock, although there are large deposits of asphaltum. The oil of this latter region has a smaller percentage of an asphaltum base than that of the coast counties farther north.

The important deposits of San Luis Obispo county which may be taken as a good example of the occurrence of this material are found along the line of low hills lying south of the town of San Luis Obispo between it and the ocean. The origin of the bitumen is clearly shown in this region and will be briefly explained.

BITUMINOUS ROCK BLUFFS, SOUTH OF EDNA, SAN LUIS OBISPO CO., CAL.

With some unimportant exception the deposits of oil and tar or bitumen in California are associated with rocks of Eocene, Miocene, and Pliocene age, and of these the most important in this respect is the Miocene. Those who have made a special study of petroleum are at the present time almost universally agreed that it is of organic origin. They believe that all facts point to its having been formed during the destructive distillation of animal remains buried in the rocks during their period of formation. These conclusions are supported in the most unequivocal manner by the conditions under which oil and its related products occur in California. The group of rocks forming the Miocene in the Coast Ranges is practically characterized by a great thickness of silicious or flinty shales with some of calcareous origin which in their unaltered condition appear to be made up almost wholly of the remains of microscopic sea animals, such as diatoms, radiolaria, and foraminifera together with broken fish skeletons. Over nearly the whole of the area occupied by these rocks in the Coast Ranges for a distance of 400 miles in a northwest and southeast direction there are indications of oil. In all sections where the organic shales are absent no oil is to be found thus indicating clearly its connection with them.

The product distilled from the shales varies greatly at different points. There can be no doubt that much of it has passed away as gas. In some places the conditions have favored its preservation as a light volatile oil with no solid base, in others the product remaining at the present time is a thick dark oil with a very large percentage of asphaltum. It is the latter oil which, after passing upward from the horizon in which it was generated, has impregnated the overlying soft loose sandstones, giving rise to the bituminous rock. It thus appears that in addition to the presence of the organic shales a proper reservoir is necessary for the preservation of the bituminous products. The shales giving rise to the oil are compact and fine grained, and if there are no strata of porous nature to intercept the distillates they will be lost or so disseminated through the narrow fissures of the rock as to be of no value commercially. It happens, fortunately, that in Ventura county associated with the shales, as a part of the same formation, there are thick beds of sandstone, and it is from these that the oil is obtained. In northern Santa Barbara and San Luis Obispo counties a different condition exists. The Miocene is formed almost wholly of shale which offers no reservoir and the larger part of the formation now appears barren of oil. At various places, however, the shales are overlaid by younger formations which do offer excellent conditions for the preservation of the oil. It is chiefly in these overlying rocks that we find the extensive and valuable deposits. Chemical action is going on in the deeply buried shales as shown by the warm and cold sulphur springs which are quite numerous, and from the fact that the oil or tar is very generally associated with these springs leads to the conclusion that it is still being generated and that the gas and flowing water forces it upward. If at the points where the tar issues from the shales there are no overlying rocks it forms a surface accumulation, but if it is overlain by sandstone it gradually percolates through the latter and in the course of ages has formed the extensive masses of bituminous rock. Large areas of the latter must have been eroded since formed, but at present there is probably all that can ever be used.

The Buchon range, southwest of the town of San Luis Obispo, is composed of Miocene shales sharply folded. Toward the southeast the shales sink and are covered by a younger formation largely composed of soft sandstone. This stretches from a point a little west of the railroad running to Port Harford southeast to Arroyo Grande, the strata being folded together in the form of an open trough. For about half the distance, beginning on Marie's ranch on the northwest, and extending to a point about two miles south of Edna, the sandstones are more or less impregnated with bitumen, especially along the outer edges of the fold. In places the process of impregnation is still slowly going on. It would be useless to try to mention all the localities along this belt where valuable material is found. Along the coast between Pismo and Port Harford are excellent exposures of the bituminized sand overlying the Miocene shales. The presence of the bitumen makes the sand much more resistent to the forces of erosion and its presence is often indicated by the weathering out of bold rocky cliffs. Many of the localities of this rock are favorably situated for working, but have not yet been prospected.

South of Edna the distinctive features of the bituminous rock formation are illustrated on a grand scale. Here areas of the rock form great bluffs rising almost 400 feet above the valley. These bluffs are shown in the accompanying engraving. Many quarries have been worked in this section in past years, but owing to certain combinations among the companies operating in the State this field has been almost abandoned for some time. One has only to make a curosory examination of this region to be impressed with the magnitude of the deposits. The sand and bitumen are already mixed by nature, forming a paying material which can be rarely equalled by that artificially prepared and which ought to be mined so cheaply as to cause its general adoption.

The question as to the presence of oil here in quantities sufficient to be commercially valuable has interested many, but the indications do not seem to have been considered sufficiently favorable to induce thorough prospecting. Two wells were put down some time since but without important results. One encountered a large flow of warm sulphur water at at a depth of about 900 feet and the locality is known as the Sycamore Warm Sulphur Springs.

The question in this region which still remains to be solved is whether oil is sufficiently thin to be pumped will be met with in drilling. There is no doubt that in the proper localities thick tar would be encountered, a tar similar to that flowing from the springs scattered over the region. It may be that the oils with a smaller percentage of permanent base do not exist here. They may never have existed or for some reason or another the volatile portions may have been expelled. The question can only be settled by prospecting.

THE lifeless condition of the mining stock business is, if possible, further deadened by the war bill which became effective on the 14th inst., by which the stock-broker is required to pay 2 cents on the transfer of every lot of stock of the "face" value of $100, and an additional 2 cents for registering it, which practically prohibits "transfer" of low priced stocks. Any stock board report illustrates this. Take, for instance, the San Francisco Stock Board, "1000 Alta, 4 cents." The "face" value of that block of stock at $100 per share would be $100,000; under the law the tax on that one transaction, if actual transfer took place, would be $20. Where, as in the case of industrials, the market and "face" values approximate, the new tax falls lightly, but unless a less rigid interpretation is put upon the law it will "knock out" the business of Board mining stocks so far as actual transfers are concerned.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771

ANNUAL SUBSCRIPTION:

San Francisco, June 25, 1898.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—Bituminous Rock Bluffs, South of Edna, San Luis Obispo Co., Cal., 661. Section of the Lightner Quartz Mill; Electric Boxcar Locomotive; Locomotive with Train of Cars, 664. Air Compressor, 665. On the Santa Fe, Prescott & Phœnix Railway; Various Elevations near Rock Butte on the S. F., P. & P. Railway, 666. Point of Rocks, Seven Miles North of Prescott, on the Line of the S. F., P. & P. R. R., 667.

EDITORIAL.—Bituminous Rock Deposits in the Vicinity of San Luis Obispo, Cal., 661. Change in Mining Laws; National Mining Legislation, 662. Mine Reserves; The Building Stones of California, 663. Miscellaneous, 661–2–3.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 670–71–72.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 686.

MISCELLANEOUS.—Economy of Electrical Transmission; Concentration of Cinnabar Ores; In Effect Next Saturday (Old Construction of the Mining Law), 664. A Simple Air Compressor; Some Metallurgical Methods at Broken Hill, Australia, 665. Development of Arizona; Liability for Injury to Miner; Experimenting with and Process by Which Sulphurets from the Plymouth Rock, Cal., Mine are Worked, 666. A Decision in Point, 667. The Rule of Safe Place; Sale of Old Metal; Precautions Against Malaria; Gun Cotton, 668. Coast Industrial Notes; Recently Declared Mining Dividends; Personal; Recent California Mining Incorporations; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 669. Commercial Paragraphs, 686. Index to Volume, 687–88.

MR. SYMINGTON'S remarks on suggested concentration of cinnabar ores on page 664 are to the point. As in many gold quartz properties in the State, present paying mines were abandoned or worked at a loss. It is not so much the mine as the manner of management. In the Ætna, for instance, the last report shows a profit for '97 of $52,685 on ore that produced 0.78 per cent quicksilver. The report shows a cost of $4.47 per ton, of which probably $4 was for mining and prospecting.

THE second session of the International Mining Congress to be held in Salt Lake City, Utah, July 6th, 7th, 8th and 9th, gives promise of being attended by more than 1000 delegates and of possessing great interest to the mining industry. The purpose and policy of the Congress has been repeatedly referred to and is commendably progressive. Pacific coast delegates have a single fare rate for the round trip over the Southern Pacific, and the same plus $2 over the Oregon Short Line.

A MEASURE of tardy justice is the Congressional bill passed June 6, calling for the revision and classification of letters patent. The national patent office has long been behind with its work, and although its receipts so exceed its expenses that there is a constantly increasing surplus, yet there has been a chronic congestion of work. By this bill (which it is estimated will entail an expense of $300,000) the Commissioner of Patents can increase the number of examiners, revise and perfect classification, and greatly expedite the work of passing upon applications for patents, an improvement that will be appreciated by inventors and others who have business with that Government institution.

IN last week's issue, in editorial reference to the colossal scheme of the West Australian Government to lay 328 miles of water pipe, mention was made of "pipe made of steel spiral embedded in concrete." Inquiry for details regarding that class of pipe is made. The pipe is manufactured in England, and, also, in New York city. In the latter city the sheet steel after being cut into strips of a width varying with the required diameter of the pipe, is riveted or welded into a continuous strip of the required length. This strip is then fed automatically into the pipe-making machine, and during its passage through it the rivet holes are punched, the laps of the edge of the strips are brought together under pressure, and held during the process of riveting. The rivets are all set by compression. The edge is slightly recessed, throwing the lap on the outside, so that the inside diameter of the pipe is maintained evenly throughout the entire length. In order to render the pipe water-tight when it leaves the machine, special hydraulic cement is inserted between the laps before riveting.

Change in Mining Laws.

Among other important subjects of general interest to be discussed at the coming convention in Salt Lake City are the proposed changes in Federal mining laws. Nothing is of greater importance to the mining world. As usual, Senator Stewart of Nevada opposes any change; he says it would "retard the development of the mineral country and tend to place valuable mineral land in the hands of monopolies."

To any one acquainted with the facts, Senator Stewart's mention of monopolies is ludicrous. With the exception of a recently extinguished Senator from Oregon, no man has been credited with being more useful to "monopolies" at the national capital.

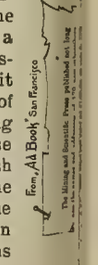
The proposed change would have precisely the opposite effect from that asserted by the Nevada Senator—merely asserted, but not discussed. As at present, a miner has often to come close to perjury to protect himself by securing a patent for his mining claim, because he may not have found "mineral in place" thereon, though it is evident that mineral does exist there in paying quantities and he be willing to spend thousands of dollars on development work demonstrating the fact. In Colorado, Cripple Creek and Leadville are substantial proofs of this statement; in California as evident facts can be cited. One of the proposed changes is an amendment to Section 2335, R. S., to contain a clause reading:

That in investigating the character of the land, with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be presumptive evidence that the land in question is and always has been mineral in character.

This applies to a variety of necessary cases, among others the drift mines, the deep gravel mining claims of California. There are in this State hundreds of miles of lava-capped divides, or ridges, in which are buried channels of ancient rivers, filled with gold-bearing gravel; the surface gives no evidence of the gold beneath. As at present, the miner must sink shafts hundreds of feet deep on each twenty acres to show what any miner already knows, that there is an auriferous channel. To get at it the less expensive and usually the only profitable way is to tunnel under the lava cap, but he may spend thousands of dollars doing that, and as he finally does reach the paying drift between the rim rock some thrifty "agriculturist" comes in just ahead of him and gets prior title at an expense of $1.25 per acre, while the channel may go from $50 to $500 per running foot in gold.

In Placer Co., Cal., on the Forest Hill divide, is a case in point, a lava-capped ridge overlying an ancient river channel; over $30,000,000 in gold have been extracted, the ground paying from $75 to $1000 per running foot. This channel is covered from 500 to 1000 feet by a cap of cement or lava, and on the surface gives no indication of being mineral land; grass, flowers and trees do not hint at the buried treasure which is reached by horizontal drifts and tunnels. On one, the Hidden Treasure, in the region mentioned, the tunnel thus opening the deposit was 900 feet long. That mine has produced over $1,500,000; $1.75 per ton of gravel. The Mayflower drift mine paid $7 per ton of gravel; there were 12,000 feet of drifts. Conservative mining experts calculate that there still remain in that one California county 200 miles of unworked auriferous gravel channels, which would yield from $500,000 to $3,000,000 per mile. The work of opening up these buried deposits is costly enough without the ever-threatening expense of contest regarding the "agricultural" character of the land, under the law as at present framed.

It is to be noted that the proposed amendment above quoted does not designate such land as mineral as may have adjacent to it discovered or developed mineral deposits, but merely that evidence may be taken that there is such mineral adjacent. If this be proven, it is then to be taken as presumptive evidence that the land in question is mineral in character. There is nothing unfair in this to the agricultural claimant; it merely gives the miner "a fair show;" he must still prove that there is discovered mineral adjacent to his claim, but he would not be menaced from start to finish in his costly work by the probability of a contest at the close, made certain if his calculations proved true and he were to unearth a valuable find.



Pages might be filled citing such instances in every mining State and Territory, but on the one side is the Nevada Senator and on the other the Western federation of miners, each agreeing that "the present laws are good enough," "we want no change," diametrically opposed on every other question, but singularly a unit on this.

There are many changes necessary in our mining laws, and precedent, tradition, corporate interests or ignorance should not be allowed to block the way.

National Mining Legislation.

There are several matters of general interest to mining men before Congress for present consideration. War measures and Hawaiian annexation overshadow nearly all other legislation, and it is doubtful if the two houses will take concurrent action on any of the matters referred to before final adjournment. In the House of Representatives a bill has been introduced to compel every mining claim owner to work out his assessment under penalty of forfeiture, to allow no man to hold more than one lode or placer claim at one time, and to reduce the size of lode claims to 300x750 feet. This ridiculous measure will not be likely to receive serious consideration from any one but its originator. The proposition to generally suspend for the calendar year the requirement for assessment work will probably get no further than the committee room, which is as far as it deserves to get. The Committee on Public Lands has instructed Congressman Shafroth of Colorado to favorably report, with amendments, the bill allowing miners who have enlisted in the army or navy of the United States to retain title to their claims during continuance of the war. The bill is amended by the addition of two provisions embraced in a similar measure recently introduced by Bell of Colorado as follows: "Those desiring to take advantage of this act shall file a notice in the clerk's office where the location certificate of said mine is recorded before the expiration of the assessment year, giving notice of his enlistment and notice of his desire to hold said claim under this act. If any such enlisted soldier or sailor has a co-owner or owners in any mining claim and who are not in the army or navy, and such co-owner or owners fail to do such a proportion of $100 worth of work per annum as the interest of such non-enlisted person or persons bears to the whole claim, then such interest shall be open to relocation by any other qualified person or persons, or by their doing the necessary work thereon and filing an affidavit of labor showing the forfeiture and that the relocators had done the annual work required of such non-enlisted persons, and succeeded them in right under this act, which work may be done at any time after the expiration of the assessment year and before owners resume work thereon. The work and affidavit aforesaid shall operate as a transfer of said forfeited interest from the former owners to said relocators." As amended this bill has possibility of passage, taking the place of the bill previously referred to, which had already passed the Senate.

SOME TIME AGO mention was made of the receipt in twenty-six consecutive working days of one month of the names of 179 new subscribers to this paper, illustrative of its growth and popularity, and the name and address of each of the 179 was published. Subsequently some of them wrote saying that they had received inquiry so far as they were individually concerned; and others wrote saying that since the appearance of their names they were inundated by a flood of contemporaneous literature, which illustrates another phase of the business. Meanwhile it is not the intention to further publish the names of the hundreds of new subscribers constantly being sent in by our traveling agents, in addition to those sent to the office direct. Since Jan. 1st, '98, each agent states on his daily subscription report the occupation of each new subscriber. With this issue closes the 76th volume. Reference to the index on pages 687 and 688 will indicate one of the reasons why the paper is so widely read. Three times during the last year the News Co. has increased the regular order for weekly delivery. It is believed that nowhere else for so small a cost could 688 pages of up-to-date information in this field be secured. The volume closing with this issue is the largest of any similar six months in the thirty-eight busy years of the paper's history.

Mine Reserves.

Several papers have been discussing the propriety of establishing a sinking or reserve fund by every producing mine, and instead of exhausting its resources by periods of dividend and periods of debt-making during its development, to place the first earned surplus in the treasury until a reasonable amount is on hand, and maintain that amount during the life of the company. The idea is worth consideration.

Probably some miners, promoters or stock brokers have not given much thought to the value or necessity of an ore or cash reserve to successful mining operations; it is an important and essential factor in the problem of success or failure. A reserve fund, of ore in the ground or cash in the treasury, is a protection against unexpected contingencies, such as a pinch in the ore body, accident to mine or machinery, caves, overflows, and many other demands upon the resources of the property.

In mines operated under prudent management a reserve fund is usually considered a necessity, evidence of sound judgment and honest intention. In too many instances, however, an honest but ill-advised effort is made to encourage those who by contributing their money have made success possible, and a premature dividend is declared, an injudicious improvement is made or the mine robbed of all its ore for current expenses or to give a shipment record. In either case the result is as bad as that brought about by the vicious manipulator who has encouraged showy improvements or premature dividends, hoping to create a boom during which he will unload his interests on the inexperienced at a big figure that will give him a large profit, and put him in shape to work another scheme of the same character.

Nearly every prominent mining camp in the Rocky mountains has such repeated history in the story of good properties having pay ore in their depths, but now lying idle, improvements going to ruin and the property resting under the ban of public condemnation because unwise management or foolish expenditure has exhausted the visible resources, the ore reserve, and left nothing with which to continue development or open up new ground. With an ore reserve blocked out in the mine, or a cash reserve in the treasury, as provided for in the manner suggested, such conditions could not exist. In some quarters the present tendency is toward manipulation and against honest development, to such an extent that he who is honest in all other matters will applaud himself for a bit of successful work in a mining deal.

Justice to the miner, to the stockholder, be his interests large or small, and, above all, to the good name of mining generally, calls for remedy in line with wisdom and good policy, and for the interest of every honest operator. Skill and ability, backed by good ore, can avail nothing against extravagance that would exhaust the reserve fund in premature shipments, dividends or showy improvements.

Men who have given the subject consideration go so far as to suggest the enactment of law, and claim that by unity of effort a statute could be secured, with penalty for its violation, requiring the value of the first output and a stated percentage of all subsequent outputs, less actual working expense account, to be retained as a reserve fund in the treasury until a sufficient amount be accumulated to meet regular expenses, such as a three-months payroll for the force employed, and necessary development, increased power, enlargement of plant, or opening up new ground, and forbidding the use of such reserve fund so long as skillful and economic working can output new ore to meet running expenses of labor and development—that is, forbid the payment of dividends from this reserve fund, or any other fund, until the earned surplus is in excess of the fund and current expenses: this to block the game of the manipulator who seeks private gain at the risk of the mine's exhaustion. Whether such a law could be secured, or, if enacted, could be made operative, is a very doubtful question. That such a law would convert many prospects into mines, and bring to life hundreds of good mines that are now lying quiet and valueless under the blight of seeming exhaustion forced upon them by the crime or folly of a management that worked on the policy of "leaving nothing in sight," is possible.

The fool's maxim is "a short life and a merry one," and if, as in his case, he alone would suffer, there would not be one to raise a voice of warning or object to his folly. But folly does not end where it begins—the merry life of one is at the expense of hundreds of hard working, worthy prospectors and people of limited means, who see weeks of hard effort pass away in one hour of extravagance; it is at the expense of the good name of an industry that should be classed among the most legitimate and not, as so often now, among speculations with a large percentage of risk, even in many promising and inviting propositions. This evil might be cured by united and earnest effort.

There is no falling off in the inquiry and demand for good mining properties, which shows that capital, as a rule, seeks this class of investment. But it is equally true that this same capital is much more cautious, sensitive and rigid in its methods of inquiry and investigation, and harder to satisfy, than it was ten years ago, and this unfavorable condition has been brought about, principally, through caution induced by the knowledge of so many properties now lying idle that at one time had a good reputation and can show shipping records. One such property in a camp, although surrounded by good producers, does more injury to the camp in the eyes of capital than can be overcome by a dozen working, paying mines.

The argument will always be, if a property is in pay, it can maintain a reserve fund, and if it cannot maintain a reserve fund, it cannot be in pay. This rule will not apply to a prospect, but it is usually safe to apply to a property that is classed as a mine. The reserve fund is the best guaranty the investor can have that his investment is in good hands, and that he has a show to receive interest on his investment.

The Building Stones of California.

There is scarcely one of California's mineral resources concerning which there is so little definite and systematic knowledge available as its building and ornamental stones. To show the truth of this statement it is only necessary to call to mind the difficulty experienced in selecting the stone for any of the large buildings recently constructed or in contemplation in the city of San Francisco. For years it has been supposed that suitable stone of many kinds, especially the finer grades, together with ornamental stones, did not exist upon the Pacific coast, and the larger part that has been used has been shipped from the East.

There is some reason for this in a new State where labor has been high and many portions somewhat inaccessible, but there is no reason why, with our present state of development and the era of more substantial and expensive buildings upon which the larger cities have entered, we should continue to be in ignorance of the home resources upon which the construction of such buildings largely depends. It seems unfortunate, when bids are made for furnishing stone, that the best and most desirable home material is liable to be rejected in favor of the imported, simply because we have neglected to acquire detailed and reliable information as to the extent and character of the quarries, as to what they are capable of furnishing. At the present time there is almost no information concerning the variety and quality of stone contained within the boundaries of the State. We know that the common granites, marbles and sandstones exist, but in the building up of a great city more is needed. We must have these rocks in variety, ornamental as well as plain stones, must know their accessibility, and have upon record accurate observations upon their physical properties. A large amount of geological work has been done in the State but it has never been directed specifically to the examination of building stones, and, although we know there is a great variety of them, yet this knowledge is not full or accurate enough to be practically valuable.

A thoroughly scientific, as well as practical, investigation of this subject is perhaps more urgently needed here than in many other regions because of the extremely complex geological conditions. The Coast Ranges in particular have been subjected to so many disturbances that many of the rocks which would otherwise be of value are so dislocated and fissured that large blocks cannot be obtained. The study of the circumstances conditioning the presence of building stones is purely a geological one and requires trained geologists if reliable results are desired. The geological conditions are, in some respects, similar to those of coal. In many places in the Coast Ranges the real character of coal seams, which have given every appearance upon the surface to the eye of the uncritical observer and upon the development of which much money had been uselessly spent, could have been shown up if the proper geological investigations had been carried out.

Many things condition the value of a stone for building purposes. In a crystalline rock it may be the degree of resistency offered to disintegration by the different components, or the presence or absence of those substances which easily oxidize and give discoloration. These questions are best solved by careful observation of the surfaces of the rock produced by nature during long exposure to atmospheric action. We may be sure that if iron stains develop upon the surface of the rock in its natural condition, or the corners and angles easily crumble away, a piece of this rock, though it may give the finest appearance when freshly cut, will eventually assume the same appearance as the weathered portion in its natural condition.

The age of a crystalline rock does not necessarily affect its value for building purposes. The value of sedimentary rocks which are used for building purposes is on the contrary largely determined by their age. The older sedimentary rocks present a much more thorough consolidation, a more complete cementation of the grains than the more recent rocks. In California the youngest sandstones of much use for building purposes are of Miocene age. They are, however, generally rather soft, and do not weather as well or stand the pressure that older rocks do. The Eocene and Chico formations contain the most of the sandstone which is available for buildings of large size. In many places they are capable of furnishing stone of excellent quality. The sandstone found upon the Sespe in Ventura county is probably the best in the State. In addition to an excellent quality there is an almost endless variety of color.

Some sandstones harden on exposure to the air while in others the material cementing the grains is more readily soluble in atmospheric waters and is finally carried away. Any rock which weathers out in large massive fragments the angles of which remain fairly sharp can be depended upon as far as durability is concerned, and it is in regard to this very quality that the most trouble with sandstones is encountered. The oldest sandstones of the Coast Ranges are of Jurassic age and though they are very extensive they offer few places where large blocks can be obtained. This is due to the disturbances which the older rocks have experienced and as a result of which they have been cracked and seamed.

It is thus seen that a thorough description of building stones demands not only a laboratory examination but also one of the conditions which they exhibit in the field. The neglect of this important consideration has led to the use of stone in many buildings which began to crumble almost as soon as they were finished.

There can be no doubt of the great benefit to the state in general and the building industry in particular if there was at hand thorough and reliable descriptions of the quarries already opened, as well as the possibilities for opening others in new regions. The geological reconnoisances which have already been carried on have brought to light many occurrences of valuable stone, but not enough is known as yet to make the exploiting work of much value.

California is a large State and contains a richer variety of stone than has generally been supposed, but as affairs are at present the production of stone is far behind what it should be. If a thorough and practical subject of the study were made, and the detailed report illustrated by specimens, a great change would certainly take place and California would come to occupy the position it ought to, considering its great natural resources in stone.

THE MINING AND SCIENTIFIC PRESS is always glad to receive and publish communications of interest in mining and metallurgy. Interchange of opinion and experience is of general value to the mining industry, and mining men everywhere are invited to consider these columns an open forum for discussion and information upon cognate topics.

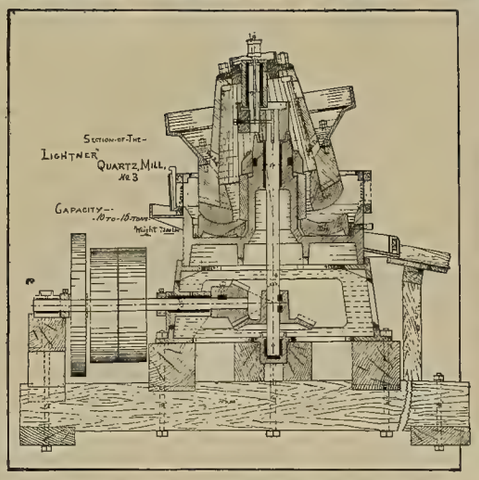
Economy of Electrical Transmission.

A notable instance of economy in electric traction is afforded by the installation recently made by the General Electric Company for the Arlington Mills, Lawrence, Mass. These mills have about two miles of track running from the main line of the Boston & Maine Railroad into the yards and throwing off spurs into the alleys between the different buildings. Previous to the change to electrical service, the haulage of the entire output of the mills to the main line, the haulage of the material from building to building, as well as the necessary switching about the yards, was done by a steam locomotive rented from the railroad. For this service the Arlington Mills paid an annual rental of several thousand dollars, and were, moreover, frequently put to great inconvenience and delay on account of the unavailability at times of any locomotive. The successful results obtained with electric factory locomotives by other mills in New England attracted the attention of the managers of the Arlington Mills to the question of electric haulage, and as a result electricity as a motive power was decided upon. The electrical installation consists of a small generating plant and two electric locomotives, one of the box type and the other a platform car. The generating plant consists of a standard G. E. 75 K. W. 500-volt railway generator driven by belt from a high speed engine. The generator readily answers all calls upon it, with no heating or sparking, although it is occasionally subjected to very heavy overloads when both cars are handling a train of more than the usual number of loaded cars.

The boxcar locomotive used for hauling material

ELECTRIC BOXCAR LOCOMOTIVE.

about the yards is shown in Fig. 1, and is equipped with two G. E. 800 H. P. motors and series parallel controllers. The platform locomotive is used to haul trains of loaded cars from the yards to the main line, and empties from the line to the mill tracks, and to do all the drilling in the yards. The equipment of this locomotive consists of two 50 H. P. G. E. 1200 motors, with the necessary series parallel controllers. In hauling heavy trains it is assisted by



LOCOMOTIVE WITH TRAIN OF CARS.

the boxcar locomotive. Together they are able to handle trains of thirty to forty empties, or twelve to fourteen loaded cars, with comparative ease and celerity. To give the necessary adhesion to the more powerful locomotive to enable it to handle heavy loads, about six tons extra is placed on the platform.

The cost of the entire electric plant is little in excess of one year's rental of the steam locomotive. No more men are employed about the electric locomotive, the labor cost has not risen and the consumption of coal is scarcely felt on the main plant. Furthermore, the plant being always ready, cars may be shifted at any time during the day or night. The appreciation of the Arlington mills is, perhaps, best shown by the fact that a second platform locomotive is shortly to be added to this haulage plant.

The Lightner Mill.

TO THE EDITOR:—In an article headed "Stamps vs. Roller Mills," in your last week's issue, you quote an opinion given by a gentleman from Oakland, in which he holds that roller mills are better adapted for

SECTION OF THE LIGHTNER QUARTZ MILL

crushing clayey and oxidized materials than hard rock. Now this may be the case with such mills as he is acquainted with, but does not apply to such mills as the Lightner quartz mill, which is a roller mill with a crusher combination, being the reverse of the well known "Gates crusher," while the Lightner mill could be built to do heavy crushing. It is thought best to crush the rock to about 2 inches, independently. The Lightner quartz mill consists of a circular mortar, with screens all around it, and a hub or shaft bearing in the center, through which the driving shaft passes and around which are wearing plates for the rock crushing part. In the mortar and around the hub there is a circular, hollow, barrel-shaped muller, which, when working, has a circularly wobbling motion, traveling on its lower end, which has a ring shoe, on a ring die in the bottom of the mortar, the motion being like that employed in moving a barrel, by slightly tipping it and rolling it on its chine, or the ends of the staves.

The rock is fed into a circular hopper surrounding the muller. Thence it passes between the inside of the shoe of the muller and the center wearing plates on the hub in the mortar, where it is crushed as in a rock breaker, then dropping onto the die in the mortar is ground by the rolling muller to any fineness desired, being washed back and forth over inside amalgamating plates or over an encircling riffle containing mercury, and discharged quickly through the screens. The Lightner mill will successfully work any kind of rock, hard or soft, and is adapted to any kind of ore, or to cement gravel. Owing to the peculiar motion of the shoe of the muller on the die in the mortar, the points of contact are constantly changing. The shoe has a slight horizontally rotating motion andd a radial sliding motion, as well as the vertically rolling motion like that of a wheel. This ever changing position of the parts in relation to each other causes an absolutely even or uniform wear of the shoe and die. At the same time the wear of metal is no more than in a stamp mill. The wearing parts are of extra hard cast iron and can be procured at any ordinary foundry, and are easily put in place.

The Lightner mills are cheaper to erect, and can be put in running order and paid for from the product of the mine before a stamp mill can be set up and the first stamp dropped. It also requires but one-half the power to do the same quantity of work as the stamp mill, and causes no deafening noise while running. There are a number of Lightner mills of from 1 to 15 tons' capacity per day in operation, proving by their satisfactory working, substantial construction, slight wear and tear, little power required, ease of management and increasing demand, that they are the best style of quartz mill in the market. The illustration shows a section of a No. 3 mill; other sizes are similar. These mills are built in four sizes by Wm. H. Birch & Co., First street, in this city, well known for their superior work in all lines of machinery, and is a guarantee that the mills will be delivered in perfect order. JOHN J. NEWSOM.

49 Merchants' Exchange, S. F.

Concentration of Cinnabar Ores.

TO THE EDITOR:—A southern Oregon correspondent in last week's issue suggests concentration of low-grade cinnabar ores. I wish to show that such concentration can be of no advantage except in very rare cases.

The furnace treatment of cinnabar ores is one of the simplest and least expensive of metallurgical processes. No method of concentration can do away with the cost of mining, and it is the cost of mining and not the cost of reduction which is the important factor.

The cost of both mining and reduction must vary widely according to circumstances, but in a country like southern Oregon where wood is only worth $1.50 per cord, the cost of reduction is less than 10 cents per ton for fuel, and the handling of the ore is the only other part of the expense of reduction, except coarse crushing through a breaker at a cost of less than 5 cents per ton. Any method of concentration involves fine crushing, vanning or jigging, and a handling of the material, costing fully as much per ton as the furnace treatment.

Briefly then, concentration is unavailable because it generally would cost more than direct treatment of the ore as it comes from the mine. The only possible exception to this would be where a large body of low-grade ore could be quarried and concentrated by free water power in a locality where cord wood was very expensive.

The small furnaces suggested are not conducive to economy. Those of 10-ton capacity are being supplanted by 40-ton furnaces, corresponding with the practice in ironworks where the capacity of furnaces is ten times what was thought desirable thirty years ago.

Referring to the idea that the manipulation of the Spanish mines is the reason for the quicksilver business not being lucrative, I think one does not need to go so far afield as Spain to find the cause. The paying mines of to-day are properties which had been abandoned, or had been worked at a loss, or had been thought to be exhausted because some rich bunch of ore gave out, till taken hold of by men who knew how essential it is constantly to keep prospecting ahead of immediate requirements.

R. B. SYMINGTON.

In Effect Next Saturday.

The Commissioner of the General Land Office, under instructions from Secretary Bliss, has fixed July 1, 1898, as the time when the old construction of the mining law, so far as it affects the patenting of groups of mining claims, will expire. On or after next Saturday the new construction, that of Dec. 15, 1897, will take effect.

Paragraph 53 of the mining regulations, approved Dec. 15, 1897, was amended to read as follows:

"The claimant at the time of filing the application for patent, or at any time within the sixty days of publication, is required to file with the register, a certificate of the Surveyor General that not less than $500 worth of labor has been expended, or improvements made, by the applicant or his grantors, upon each location embraced in the application, or if the application embraces several locations held in common, that an amount equal to $500 for each location has been expended upon, and for the benefit of the entire group; that the plat filed by the claimant is correct; that the field notes of the survey, as filed, furnish such an accurate description of the claim as will, if incorporated in a patent, serve to fully identify the premises, and that such reference is made therein to natural objects or permanent monuments as will perpetuate and fix the locus thereof; *provided*, that as to all applications for patent made and passed to entry before July 1, 1898, or which are by protests or adverse claims prevented from being passed to entry before that time, where the application embraces several locations held in common, proof of an expenditure of $500 upon the group will be sufficient, and expenditure of that amount need not be shown to have been made upon, or for the benefit of, each location embraced in the application.

"BINGER HERMANN, Commissioner.

"Approved: C. N. Bliss, Secretary."

It will be observed that the $500 need not be expended "on" each claim where the application comprises several locations, but "for" each claim. The aggregate amount in such cases must represent as many times $500 as there are locations, and in such case the entire amount can have been expended on one of the claims provided it can be shown that such amount tended to develop or improve entire group.

A Simple Air Compressor.*

C. P. TURNER.

The hydraulic air compressor herewith illustrated is an application of an old principle, viz., the tendency of a current of any gas or liquid, flowing through or around another fluid, to carry the surrounding fluid along with it. A mixture of the two will thus be formed, which, if the strength of the current is great enough, will be carried along through any tube or closed channel that may be provided for their passage. The application of this principle to the injector, the jet pump, the steam blower, and similar devices—where a current of steam flowing from a nozzle with a high velocity is made to propel water or air from a chamber surrounding the jet through a pipe leading to the required point of discharge—is familiar to machinists and engineers.

One of the earliest devices for furnishing a blast of air for blowing the fires used in making iron from its ores, where other power than that furnished by the muscular exertion of men or animals was employed, was the blower shown in Fig. 1 and called a

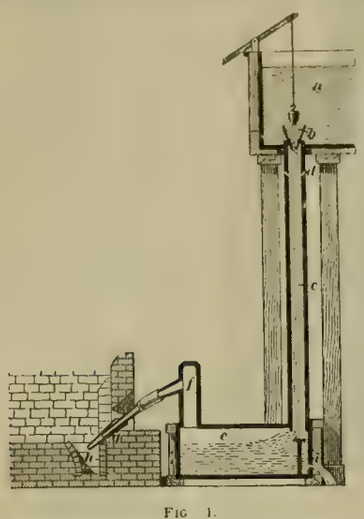


FIG 1.

trompe, a jet of water flowing down through the conical nozzle *b* from the sluice *a* into the pipe *c*. The jet, in its passage through the pipe, carries the surrounding air with it, thus drawing a steady current of air in through the holes *d* and carrying it down into the chest *e*. The water settles to the bottom of this chest and flows through the hole *i*, while the air rises to the upper part and from there is forced out the pipe *f* and the nozzle *g* into the fire on the hearth *h*. This device, while simple and cheap, was not capable of furnishing a high pressure of blast, and never reached a high degree of efficiency in the use of the falling water, the best efficiency obtained, according to good authorities, being not more than 15 per cent. For these reasons its use has always been limited to periods and districts where only the most simple mechanical devices could be obtained.

Another and more modern application of this principle is seen in the "injector" condenser shown in Fig. 2. In this case the work to be done, instead of taking air from the surrounding atmosphere and

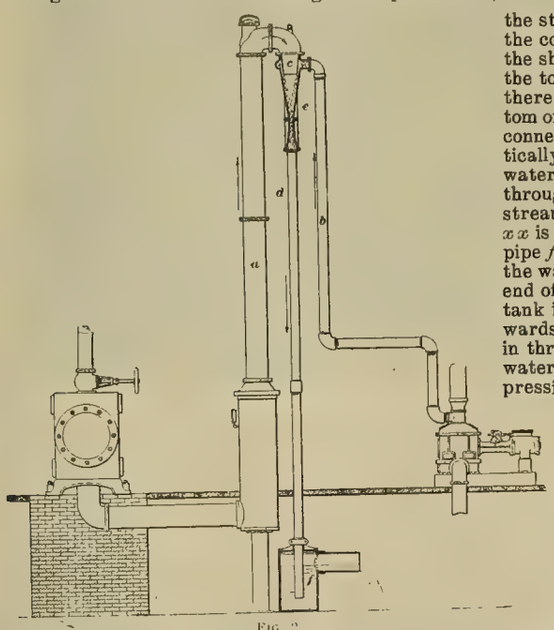

FIG 2.

delivering it at an increased pressure in an enclosed vessel, is to remove the air and vapor from a closed space and deliver it into an open vessel against the pressure of the atmosphere; at the same time the water that is employed in removing the air from the the exhaust pipes serves also to cool and condense the exhaust steam.

In Fig. 2, which shows the condenser attached to a Corliss engine, the exhaust steam passes from the cylinder through the pipe *a* to the top of the condenser. Water from a pump, or other source of supply, enters the condenser through the pipe *b*, surrounds the conical inlet *c*, and flows downward around the lower edge of this inlet in a thin stream. The exhaust steam from *c* is condensed by coming in contact with this stream of water, and at the same time any air that may have entered the cylinder or exhaust pipe, and any condensed vapor, are caught by the downward current of water and carried through the discharge pipe *d* into the hotwell *f* below. The lower end of the discharge pipe dips below the surface of the water in the hotwell, so as to prevent any return of air through it when the condenser is not working, or when the quantity of water flowing through it is insufficient to keep the pipe filled.

In order to obtain a good vacuum it is necessary to make the length of the discharge pipe great enough to provide a column of water whose weight will balance the pressure of the atmosphere; that is, the condensing tube *e* must be placed at least 34 feet above the surface of the water in the hotwell.

Coming to the hydraulic air compressor under discussion, we found the principles illustrated above extended so as to utilize the fall of large quantities of water in compressing air to a pressure great enough to make it available in driving air pressure engines and pneumatic machinery of all classes. A deep well, or shaft *a*, Fig. 3, is dug in the vicinity of

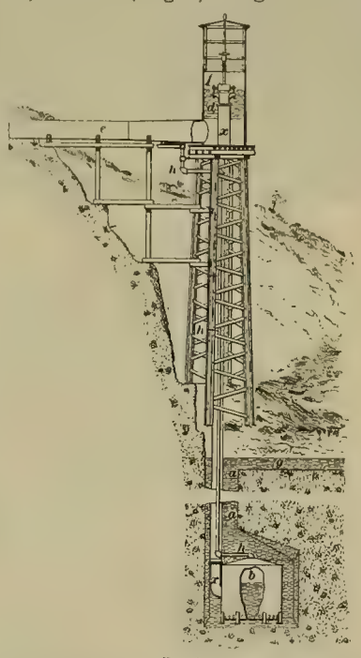

FIG. 3

the stream below the fall, and a large tank *b*, called the compression tank, is placed at the bottom of the the shaft. The compression tank, which is closed at the top and open at the bottom, is so placed that there is a space between the bottom edge and the bottom of the shaft, as shown in the figure. A tube *x x* connects with the compression tank, and rises vertically to a level, a little below the surface of the water in a receiving tank *d*, which is supplied through a penstock, or flume *e*, leading from the stream above the fall. The upper end of the tube *x x* is slightly enlarged, and is fitted with an air inlet pipe *f*, which leads from a point above the surface of the water in the receiving tank, down into the upper end of the tube. Water flows from the receiving tank into the upper end of the tube, and flows downwards past the end of the air inlet pipe; air is drawn in through the pipe *f* by the downward current of water, and is carried with the water into the compression tank. Here the velocity of the current of water and air is checked, thus allowing the air to separate from the water and rise to the top of the tank, while the water is forced out below the bottom edge, rises through the shaft, and finally flows away through the channel of the stream below the falls. As will be readily seen by an inspection of the figure, the air in the compression tank is subjected to a pressure proportional to its depth below the surface of the water in the overflow channel *g*, and is thus compressed to a degree depending on the depth of the shaft.

Since a head of water equal to a depth of 1 foot produces a pressure of .434 pound per square inch, we see that in order to get air at a given pressure—say sixty pounds per square inch—the shaft must be deep enough to bring the air in the compression tank 60 ÷ .434 = about 138 feet below the surface of the water in the overflow channel.

A pipe *h* leads the air from the compression tank to the mill or mine where it is to be used.

The quantity of air that will be furnished by this device depends on the height of the fall, the quantity of water that can be used, and the construction of the air and water inlets. As has been said, the efficiency of the old trompe for furnishing a blast was very low, and the pressures obtained were small; consequently it has generally been replaced by some form of blower driven by a water wheel or other power. The makers of this compressor, however, claim a good efficiency for their apparatus, and, as has been seen, the pressure obtained may be made as great as may be desired by making the shaft sufficiently deep. Some of its apparent advantages, as a method of utilizing a fall of water for producing a supply of compressed air, are its simplicity of construction, which should make the cost of operation and maintenance small, and the fact that the air, while being compressed, is in such close contact with water that the heat developed during its compression is at once absorbed by the water, thus allowing the compression to take place at a practically constant temperature, and reducing, to a considerable extent, the work required to compress a given quantity of air.

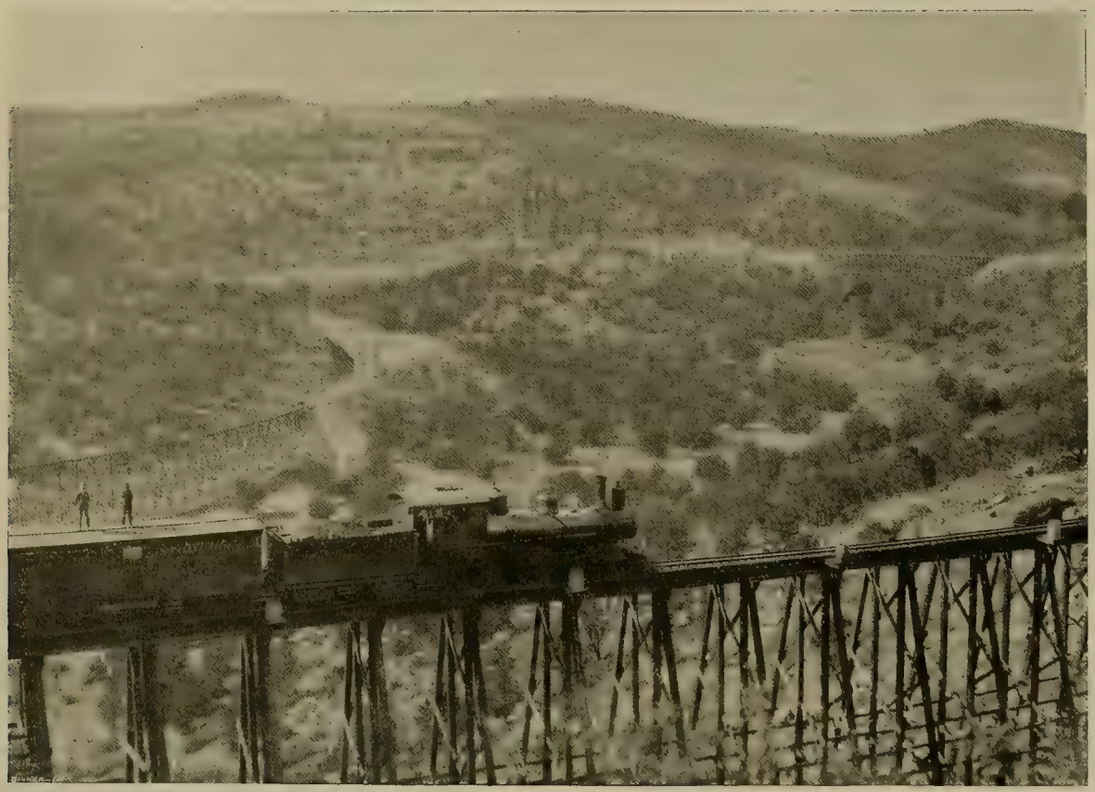
Some Metallurgical Methods at Broken Hill, Australia.*

NUMBER VI.—CONCLUDED.

Zinc Recovery.—No effort has been made until lately in Australia to recover the zinc from the ore, either directly or from the by-products of the zinc tailings. The Ashcroft process for the recovery of zinc has now been at work some time, but so far no results have been published as to its success or otherwise. The process this company originally started with was an electrolytic one. The ore was to be roasted, and then leached with ferric chloride, oxide of iron depositing with the residual ore, and a zinc chloride being produced. This, on purification from any gold, silver, or copper dissolved, was then subjected to the electric current in vats, the anodes being iron and the cathodes zinc. The idea was to regenerate the ferric chloride again, but it is said that some difficulty has been experienced in making the cycle of operation act properly; in fact, that the chlorine, instead of being all liberated as hydrochloric acid, and therefore in a condition to act on the iron anodes, is liberated as free chlorine and is lost. The amount of manganese in the ore, and which goes into solution on leaching the roasted ore with the ferric chloride, is also said to have interfered considerably with the deposition of the zinc, more especially after the leaching solution has got somewhat charged with the salt of this metal. By their latest reports, however, they claim to have overcome all the difficulties which have delayed them in the past, and we hope to hear in the near future of the results of their efforts. The chief ore supplies which the mines now have left are, apparently, unlimited supplies of zincose lead sulphide, and there is no doubt of the effect a good process for zinc would have on the prosperity of the whole of the sulphide mines.



Other attempts have been made to recover the zinc, amongst which is an ammonia process brought out by Mr. Carmichael, late of Block 10, and now of the Proprietary. This is based on the following reaction:

1. $Zn\ O + (NH_4)_2\ SO_4 = Zn\ SO_4 + 2\ NH_3 + H_2\ O$.
2. $Zn\ SO_4 + 2\ NH_3 + H_2\ O = Zn\ O + (NH_4)_2\ SO_4$.

A short description of the process is as follows: The ore is first finely ground and roasted, to leave as much of the zinc as possible in the state of the soluble sulphate. It is then placed in iron retorts and heated with sulphate of ammonia to complete this part of the process and bring about the first reaction given. The ammonia distils off through a pipe leading from the end of the retort, and dips below the surface of a solution of zinc obtained by leaching with water ore, which has been subjected to the retort treatment. The second reaction $Zn\ SO_4 + 2\ NH_3 + H_2\ O = Zn\ O + (NH_4)_2\ SO_4$ is then obtained. The precipitated zinc oxide is filter-pressed out, and the filtrate of diluted regenerated sulphate of ammonia has then to be evaporated and crystallized out ready for use again. Like all ammonia processes, the extreme difficulty of making the joints in the various parts tight when free ammonia is present has been, in this process, the stumbling block. It is now stated that this difficulty has been overcome, and, if so, we may soon hear of oxide of zinc being prepared by the Proprietary Company from their ores. The process is a beautiful one in its chemical reactions, but hitherto the loss of ammonia has been prohibitive of its use. Other oxide processes are the magnesite and the calcium chloride processes, both owned by the Smelting Company of Australia, but so far no attempts have been made

* Condensed.

to start work with them on a large scale. This company also owns the Siemens-Halske electrolytic process for the production of metallic zinc. The solvent used with this process to extract the zinc from the roasted ore is either sulphuric acid, or sulphate of iron and alumina, or sulphate of alumina alone. There is no doubt that sulphate of iron would act as a good solvent for the zinc, and, unlike the leaching solution Ashcroft process, all of them could be regenerated with no loss, except leakage from pipes and waste of that kind. I am trenching on the delicate ground of the problem of the sulphide ores, and therefore will say no more on the zinc recovery processes; but before leaving the subject I may be permitted to hope that so vast a field will continue to find workers, and that in time the just reward of their efforts will be obtained, and the wealth of the immense sulphide mines of Broken Hill be brought within reach.

ON THE SANTA FE, PRESCOTT & PHŒNIX RAILWAY.

Development of Arizona.

Arizona is attracting deserved attention. A prominent factor in the mineral development of that Territory are the railroads, lack of adequate means of transportation having been a serious drawback to the mining industry. The Santa Fe, Prescott & Phœnix Ry. Co. is aiding in the development of central and southern Arizona. From Ash Fork (west of Flagstaff) this road extends southward through Prescott to Phœnix. On this page and the following are presented three characteristic scenes on that road, which, in its building, presented many intricate problems in railroad engineering which have been successfully solved. In the issue of the 11th inst. appeared a detailed description of the great steel dam built near Ash Fork, the northern terminus of the road. The S. F., P. & P. Ry. Co. is now building a branch line from Massicks, a short distance north of Prescott, to Mayer, twenty-six miles, developing a promising mining region.

VARIOUS ELEVATIONS NEAR ROCK BUTTE ON THE S. F., P. & P. RAILWAY.

Liability for Injury to Miner.

When the superintendent of a mine, knowing that stones had been constantly falling down the surface of the mine at a certain place, and that it was more dangerous than other parts of the mine, put a miner at work immediately under it without informing him of the danger, or without having the surface raked, the owner is liable for the resulting injury to such miner, who was ignorant of the danger. (De Weese v. Merameo Iron Mining Co., Supreme Court of Missouri, 31 S. W. Rep. 110.)

Experimenting With and Process by Which Sulphurets from the Plymouth Rock, Cal., Mine are Worked.

About a year ago T. K. Code was engaged by T. T. Lane to find a cheap process for working the sulphurets of the Plymouth Rock mine, six miles north of Milton, Calaveras Co., Cal., for which they had been paying $15 per ton. The process by which the ores is now worked costs $6.50 per ton. The sulphurets contained 8% to 30% zinc, 1% to 5% copper, 3% lead, 5 ozs. and 7 ozs. silver and 1½ oz. gold.

In the following article Mr. Code gives the details of the experiments and results. It is believed that the process was based on an original idea of his own:

Chemical analysis showed, besides gold and silver, copper from 1% to 5%; zinc from 8% to 30%; lead 0% to 3%. Some 2000 tons were on the dump and by exposure had oxidized sufficiently to make a preliminary washing a necessity before cyanide treatment. But the percentage of copper sulphide was high enough to make the process costly in consumption of cyanide. It was then decided to roast the ore, leach out the salts and treat the residues by cyanide.

Experiment No. 1.—At the Utica plant, Angels Camp, ten tons were roasted in an ordinary reverberatory furnace, the roasting occupying about seven hours. While cherry red 400 lbs. salt was added to each ton of roasted ore and the roast continued for some minutes longer, thus converting the copper, silver, zinc, lead and some iron into soluble chlorides. After standing in piles for about six hours the roasted ore was placed in leaching tanks capable of holding two tons, and for a filter 6 inches of gravel were used. After standing for ten hours in 300 gals. water per ton of ore, the solution was allowed to filter off and run to a reservoir and used as spoken of hereafter. To take out all remaining traces of copper as far as possible, 15 lbs. of sulphuric in 75 gals. water were now added and after standing six hours in contact drained off. To get rid of acid water was allowed to run on ore and drain off at same time. After draining pretty thoroughly (moisture of 4%) the ore was removed to cyanide agitation and there treated by that process.

By roasting one would naturally suppose the zinc going off more or less as an oxide, some gold would be carried with it. At a high temperature this undoubtedly would take place. From 5% to 8% of zinc went off as oxide and generally it deposited in back of oven and at foot of stack. The doors of the furnace were always covered by the white powder. As the temperature was low while roasting no gold was lost, and as the ore lost in weight so the value per ton increased. If the ore was not allowed to stand some time after drawing from the furnace, it had a tendency to bunch up into balls from 1 inch to 6 inches, and for an hour or two after being piled the interior of the pile was red hot. The object was to allow thorough chloridizing.

Cost.—This way of working the sulphurets cost $8.75 per ton. It has several obvious drawbacks besides the cost; has to be handled too much. It cost $2 per ton treated for salt and constant analyses by a chemist, as the process has to be carefully watched.

Extraction.—The extraction by this process was for gold from 90% to 98.2% and for silver 75% to 86%. The copper extraction was never more than 68%.

Experiment No. 2 and Present Process of Working the Sulphurets.—The sulphurets are roasted and treated

by chlorination in the ordinary way, the chlorine taking the gold, copper and zinc into solution from which the gold is precipitated by sulphate of iron and the solution run off to reservoir above spoken of. Then the residues are treated with hyposulphite solution for the silver and after precipitating the silver the solution is pumped up to leach next batch.

Extraction.—The extraction of gold is 95%, silver 90% and copper about 60%.

Treatment of Solution for Copper and Zinc.—The solution coming from experiment No. 1 being a chloride and sulphate solution respectively, was more easily treated by electrolysis than the solution as obtained in experiment No. 2.

The electrolytic plant consisted of dynamo and twelve tanks, each 3'x4'x1', inside measurements. These were arranged one above the other on a slight grade, the top of each tank being connected by a rubber hose with the bottom of the next tank, the two holes in each tank being diagonally opposite so as to promote circulation. Plates used were alternate lead and copper 2 inches apart and allowing about an inch all around free. These were suspended from ¼-inch copper wires running across tank.

POINT OF ROCKS, SEVEN MILES NORTH OF PRESCOTT, ON THE LINE OF THE S. F., P. & P. R. R.

(*See Opposite Page.*)

The deposit of copper was at first spongy, most of it falling off plates and sinking to the bottom of vat. But after careful study and manipulation, in which lime was used to neutralize excess of acid, a firm deposit of red copper was obtained. After exhausting all the copper in the solution zinc plates were put in place of the copper and the voltage increased. About 30% of the zinc in the solution could be obtained free from iron, but above that the iron would come down on the plates. As fast as the zinc deposited, lime was added in known quantities to keep up the neutral state of solution. The precipitated zinc used in the cyanide plant worked very successfully.

The solution from experiment No. 2 as it now comes from the chlorination plant offers many difficulties to the electrolytic process, on account of the mixture of salts and solutions, and as the copper has been running too low to treat electrically, scrap iron is used and the cement copper scraped up, sacked and sent to smelter. Should the percentage of copper increase enough to warrant it, the dynamo will probably be started again.

Cost.—Cost of working ore at present time, as shown in experiment, is $6.25 per ton treated.

T. K. CODE.

A Decision in Point.

In the issue of May 28, '98, editorial reference was made to the question of cutting timber upon mineral lands in California and a decision cited in the case of the U. S. vs. Benjamin. Subsequent inquiry makes it manifest that the publication of that decision would be of interest to the mining world. It is accordingly appended in full:

UNITED STATES v. BENJAMIN.

Circuit Court, District of California (21 Fed. Rep., 285). Public Lands—Cutting Timber on Mineral Lands in California—Act of June 3, 1878, chapters 150–151.

Timber upon mineral lands in the State of California is protected and governed by the provisions of the Act of June 3, 1878, chapter 151 (20 Stat., 89), made specifically applicable to that State, and not by the general provisions of chapter 150 of the Act of June 3, 1878, (20 Stat., 88), which can only operate upon "mineral districts," if any there be, not specifically provided for by designating the particular State or Territory in which it is situated by name.

SAWYER, J.: The United States bring this action to recover the value of lumber alleged to have been manufactured from timber trees unlawfully cut on the public lands. The defendant, as a justification, specially answers that the trees from which the lumber in question was manufactured grew and were cut "in a mineral district of the United States," known as such throughout the State, and so recognized by the customs of miners and the decisions of the courts, and designated "the Georgetown Mineral and Mining District," being "in the mineral belt of said State of California and county of El Dorado;" that defendant was and is a citizen of the United States, and a bona fide resident of said "Georgetown Mineral District;" that the land on which said trees grew was public land of the United States, mineral in character, and not subject to entry under existing laws of the United States, except as mineral lands; that the lumber "was used in said mineral district and adjoining mineral districts of said county of El Dorado for building, agricultural, mining, and other domestic purposes, but principally for mining purposes; that said timber was felled, removed, and used for the said purposes, * * * in accordance with the rules and regulations prescribed by the Secretary of the Interior;" and that said timber "was felled and removed, and said act committed, under a license from the United States, under and by virtue of an Act approved June 3, 1878, entitled "An Act authorizing the citizens of Colorado, Nevada and other Territories to fell and remove timber on the public domain for mining and domestic purposes."

The Act under which defendant attempts to justify provides—

That all citizens of the United States, and other persons bona fide residents of the State of Colorado, or Nevada, or either of the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, or Montana, and all other mineral districts of the United States, shall be and are hereby authorized and permitted to fell and remove, for building, agricultural, mining, or other domestic purposes, any timber or other tress growing or being on the public lands; said lands being mineral and not subject to entry under existing laws of the United States, except for mineral entry in either of said States, Territories, or districts of which such citizens or persons may be at the time bona fide residents, subject to such rules and regulations as the Secretary of the Interior may prescribe for the protection of the timber and of the undergrowth growing upon such lands, and for other purposes.

The United States attorney insists that this Act is not applicable to the State of California, and, consequently, it can afford no justification of the acts complained of. The defendant, on the other hand, contends that the words "*all* other *mineral* districts of the United States" embrace every "*mining* district," recognized as such by the customs of miners or the locality embracing it, in whatever State or Territory it may be situated. A similar question arose in the Circuit Court for the district of Oregon in U. S. v. Smith, in which Deady, J., after a full and careful consideration of the question, held that the Act did not apply to the State of Oregon (U. S. v. Smith, 8 Sawy., 101; S. C., 11 Fed. Rep., 487). If it does not apply to Oregon, for similar reasons it is inapplicable to California.

After a careful consideration of the question, I am constrained to concur in the conclusion reached by the District Judge of Oregon, and hold the provision to be inapplicable to California.

If this Act stood alone, the position taken by the defendant's counsel would not be without plausibility. But, unfortunately for him, it does not stand alone. On the same day another Act was passed, specifically applicable to timber lands in the States of California, Oregon, Nevada and Washington Territory, which contains provisions wholly inconsistent with the provisions relied on in the Act relating specifically to Colorado and the Territories therein named. It does not appear which Act was in fact first passed, but probably it was the first-mentioned Act relating to Colorado, etc., as that is designated in the statutes as chapter 150, while the Act relating to California, etc., is numbered chapter 151 of the statutes (see 20 Stat., 88, 89). If the latter Act is to be treated as a subsequent statute, it repeals the inconsistent provisions of the prior Act, as it expressly provides that "all Acts and parts of Acts inconsistent with the provisions of this Act are hereby repealed," (Sec. 6). But the most favorable view for the defendant is to regard the two statutes, as they were both passed on the same day, as constituting but one statute, the former part of the Act making specific provisions for Colorado and the other States and Territories named therein. So viewing the statute, we must, if possible, construe all the provisions in such manner that every part can stand and have effect.

In such cases, also, loose general provisions of doubtful import in the former part of the statute must yield to subsequent clear and specific provisions, which are so explicit as to admit of but one construction. The clause "all other mineral districts of the United States," in the first-named Act, as shown by Deady, J., in the case already cited, is very general and exceedingly indefinite and uncertain as to its application, while the provisions of the other Act are made *specifically* applicable to the State of California by terms so clear and explicit as not to be open to any other construction. The most that can be said of the general clause is that it can only refer to "all other mineral districts of the United States" not otherwise specifically pointed out by other provisions of the Act—the two Acts being regarded as one. But California is otherwise specifically provided for. In my judgment, the timber upon the public lands in the State of California is protected and governed by the provisions of the second Act, made specifically applicable to California, and not by the loose *general* provisions of the first Act, which can only operate upon "mineral districts," if any there be, not specifically provided for, by designating the particular State or Territory in which it is situated by name.

To hold otherwise would be to make the specific and certain yield to the general, indefinite, and uncertain, which would be contrary to the well-established canons of statutory construction. The second Act expressly provides "that after the passage of

this Act it shall be unlawful to cut, or cause or procure to be cut, or wantonly destroy, *any timber* growing on *any lands* of the United States in *said States* and Territories," of which California is the first specifically namad in the Act: "*Provided*, That nothing herein contained shall prevent any *miner* or *agriculturist* from clearing *his* land *in the ordinary working* of his mining claim, or preparing his farm for tillage, or from taking the timber necessary to support his improvements." Thus it will be seen that the right to cut timber is much more restricted as applied to the States and Territories named in this Act than the right conferred on the residents of the States and Territories named in the other Act. In this Act the right is limited strictly to the *miner* and *agriculturist*, and is restricted to cutting timber on his *own mining claim* or *farm*, and to the purpose of clearing in the "ordinary working of his mining claim, or "preparing his farm for tillage," and to "taking the timber necessary to support *his* improvements." The part of the answer in question does not show defendant to be either a miner or farmer, for that he cut the timber on his own mining or farming claim, or that he did it for any of the designated purposes. Indeed he does not attempt to bring himself within the provisions of this Act relating specifically to California, but he relies wholly on the other Act, which specifically relates to Colorado, and the other Territories and districts therein named, in general indefinite terms, which latter Act is much more liberal in its provisions than the other.

It follows that the facts alleged are insufficient to constitute a defense, and, if true, are wholly immaterial.

The demurrer must be sustained, and the motion to strike out granted; and it is so ordered.

The Rule of Safe Place.

The doctrine that a mining company can send its employes into the bowels of the earth to conduct its mining operations without making any provision for the proper supervision and inspection of the mine for the security and protection of the miners and the mine, is unsupported by authority, is opposed to sound public policy, and is cruel and inhuman. Miners do undoubtedly take upon themselves all the ordinary and usual risks of the business, but what are these ordinary risks? They are the risks incident to the business when it is conducted by the mine owner according to the customary and approved methods and with due regard to the safety of the miners. The neglect of the mine owner to discharge his duty in this regard is not one of the risks assumed by the miner, but is a negligent act on the part of the mine owner which renders him liable in damages to any miner injured thereby. It is the duty of the mine owner to provide a competent foremen or inspector to superintend the working of the mine; it is the duty of this foreman to direct the miners when and where to work; and it is particularly his duty to make timely inspection of the timbers and walls and roof of the mine, in order that no harm may come to the miners from causes which a capable and diligent inspector would discover, and, when discovered, remove or cause to be removed. Where blasts are used in a mine, it is the imperative duty of the foreman to be diligent in discovering the effect of the blast upon the timbers, walls and roof of the mine, and to point out to the miners any dangerous conditions resulting from the blast, and to cause these conditions to be removed without delay, by proper appliances and with as little danger to the men as practicable. Mining is a necessary and permanent business, and must be conducted in an intelligent, orderly and systematic manner, not alone for the protection of the miners, but for the preservation of the mine itself. For these reasons, the business must have an intelligent and competent head. The necessity for this is imperative. When properly conducted, there is no pursuit in the country carried on with greater regularity, system and order, and with a stricter observance of rules intended to secure employes against accidents and property from loss or damage. The conditions confronting the miners from day to day, as a rule, are neither unexpected nor unusual. They are the common and expected incidents of mining, and, when the foreman does his duty, they are provided for and met without accident or any special danger. There is nothing hasty or haphazard about the business. (Finlayson v. Utica Mining & Milling Co., Circuit Court of Appeals, Eighth Circuit, 67 Fed Rep. 507.)

Sale of Old Metal.

The area bounded by Market, Third, Bryant and Spear streets, San Francisco, supplies considerable in the way of waste metal, from the sale of which some money is made by those who make a specialty of handling it. On the Atlantic side, under the generic name, borings, are grouped the different grades of waste iron which must be handled by shovelfuls or by the barrel. Borings may be of cast-iron chips, wrought-iron turnings, needle-point chips or steel turnings. In some large scrap-iron yards but two words are used to describe these fine particles of iron. Under the general title, "borings," are cast-iron chips and needle-point iron, while "turnings" is descriptive of the small, crescent-shaped particles of wrought iron and the long shavings of wrought iron and steel produced by the planing machine.

Cast-iron borings are the by-product of all machine shops and foundries. Sometimes, when the quantity produced is small, the cast chips are mixed with the wrought-iron turnings or thrown out with the waste molder's sand from the foundries. Larger shops usually keep the grades separate. As these cast chips are merely the trimmings from the castings where the hot iron found a small defect in the mold, or the crank dividing the parts of the mold one from the other, one might suppose that it would take a long time to produce a ton of 2240 pounds of waste in this manner, but many of the large machine shops and foundries in and about New York and Philadelphia produce from three to five gross tons of borings and turnings per week.

When one considers that, on a rough calculation, a pound of chips represents the waste from fifty pounds of finished castings, some conception of the magnitude of the iron industry thereabouts may be had. Borings and turnings are sold by their producers to scrap-iron dealers on yearly contract if the quantity be large. These dealers cart them away from the shops to their yards or ship them directly from the shop to the customer whenever practicable. Cast iron is a bright gray in color, and the particles consist of splinters but slightly held together, which are readily separated by a blow from a hammer, for cast iron, even in bulk, is very brittle.

Needle-point iron is produced in foundries where chilled rolls are prepared. Ordinarily, the molten iron is allowed to cool slowly, but when it is desired that the castings shall be harder than usual the iron is quickly cooled by thrusting it into water. Because of this hardening the trimming knives take off narrower and longer particles. The fine dust of both cast and needle-point iron is sold to lithographers or to the manufacturers of fireworks, whence it reappears on the Fourth of July in the form of sparks from the Roman candles, rockets, pinwheels, etc., the explosion heating it temporarily to a white or red heat, according to the amount of powder present.

Wrought-iron turnings are the product of all machine shops. Formerly these turnings were sold covered with oil which is used to facilitate the passage of the drill through the plate of iron, but in most shops to-day turnings are wrung out, so to speak, in a centrifugal machine, and the oil thus saved for reuse is a considerable item of economy in large shops.

It should be noted that borings and turnings are more properly by-products of the iron business than scrap iron, for the latter includes the wastes of other manufactures. All old machinery that cannot be sold second hand is turned over to the scrap iron dealers for breaking into pieces convenient to handle. Old boilers are purchased in place by these dealers, who then employ men to whom boiler breaking is a trade, and, working with huge iron hammers and steel wedges, the bolts are quickly cut and the boiler plates recovered separately. Boilers costing originally from $100 to $2000 are worth but their weight in iron when sold to a dealer in scrap iron, and rarely net more money to the factory discarding them than $25.

Old pumps, engines, and machinery of every description may be found in iron yards, preserved in their entirety if there be the remotest chance of selling them to an unwary purchaser, but usually old machinery is broken up as fast as it is received, the brass parts piled together and the iron, cast and wrought, and the steel piled separately. Old horseshoes, barrels, hoops, iron pipe and old rails are all grist to the mill of the scrap iron dealer, and for each he has his especial list of customers, who use that particular grade of iron, each for his own particular purpose.

Of recent years borings and turnings have found a different outlet than the familiar return to the furnace or cupola. Our chemical industry claims large quantities of them yearly. A large firm in Cleveland, Ohio, utilizes all its borings and mill scale for the production of green vitriol, more commonly known as copperas. Copperas is largely used as a disinfectant, in dyeing fabrics, and in the chemical trade; also for the production, by incineration, of the rouge used for polishing brass or silver.

In all of these chemical uses the iron is dissolved in acids, such as oil of vitriol to make copperas, muriatic acid to make muriate of iron, and nitric acid to make nitrate of iron. These solutions are then evaporated to crystals for convenience in shipment, or utilized in solution by their manufacturers. Formerly large quantities of copperas were imported into this country, but now nearly all of the green vitriol is made in America.

Prices in the scrap iron market are necessarily controlled by the price of pig iron, for the greater part of the borings and scrap iron produced finds its way back to castings again, through the medium of furnaces or cupolas, adapted especially for handling material so dense as borings and turnings. The prices of the latter range from 20 to 25 per cent lower than prices of pig iron, and a few foundries find it economical to use them alone.

Scrap iron commands a relatively higher price than borings or turnings, for foundries fitted up to use pig iron can very conveniently make use of large pieces of scrap iron for melting, and thus its market is less restricted. Borings and turnings labor under another disadvantage, however, for, in comparison with the larger pieces of waste iron, the former are impure. Stored on the floor under the machines they are exposed to the accumulation of dust from the floor, dirty waste used by the workmen to wipe oil from their hands, tools carelessly thrown down and forgotten in the rush of work, rubbish of every sort, and brass or lead filings from finishing departments. This accumulation of impurity entails a loss in iron of from 10 to 20 per cent in weight to the purchaser, hence their lower price.

Precautions Against Malaria.

W. T. Hornaday gives the following advice to soldiers about to go to Cuba: "After living in the most malarious jungles on earth, in the midst of swamps, drinking swamp water, and often having to eat unaccustomed and badly cooked food, I never had but one touch of jungle fever, and that only laid me up for six or seven days. I owe my excellent health to two or three precautions. I never slept on the bare ground or in the rain, and always under shelter. I always wore light flannels next to the skin, and never slept in damp clothes. Whatever else I might have to do without, two changes of flannel underwear besides that I had on were always at hand. Take from five to six grains of quinine every morning in a cup of hot coffee, if you have it; if not, then in hot water. Have your shoes to fit you, even if you must buy them yourself, though the United States is furnishing its troops with an excellent marching shoe. With these precautions and a dose of some light laxative once a week, there need be no more fear of fever in Cuba than there is in California."

Gun Cotton.

In these war days mention is made of gun cotton among other high explosives. The process by which so common and harmless a substance as cotton is converted into a high explosive is a simple one. Ordinary cotton waste is steeped in a solution of one part of nitric acid and three parts of sulphuric acid. The nitric acid renders the cotton explosive, the sulphuric acid being required only to absorb the water. After the cotton has soaked in the acids for several hours, it is taken from the pots and squeezed through heavy rollers to extract all the superfluous acid which it has not absorbed. Then it is washed carefully and thoroughly, still with the same object of removing the free acid. If any of this remained, its tendency would be to cause chemical changes in the gun cotton and decompose it. After being washed it is passed through a machine similar to that which grinds up the rags in a paper mill. Here it is crushed thoroughly and afterwards washed again until the last trace of free acid disappears, and the cotton comes out in the form of a soft, white pulp, closely resembling the pulp of which paper is made.

This concludes the process of actual manufacture, and it now remains only to convert the gun cotton into the most convenient form for the use to which it is to be put. If it is to be employed in making powder it is dried and stored away in pulverized form; but if it is designed for filling torpedoes it must be compressed to a certain density and moulded into the shapes which will best enable it to be packed into the torpedo heads. These shapes vary according to the design of the torpedoes and the method of packing. Sometimes they are discs and sometimes cylinders, flat squares, or cubes.

If uncompressed and dry the gun cotton would be extremely light, weighing no more than ordinary cotton wadding; but when made into the above forms it is compressed to the density of an equal amount of water. The percentage of moisture remaining in the gun cotton when it is packed into torpedoes varies between fifteen and twenty. So safe from explosion, unless detonated, is a brick of wet gun cotton that it may be placed upon hot coals. As the moisture dries off from the outside, the cotton flakes off and burns quietly. Perfectly dry gun cotton when confined in a strong case will explode with great violence if exposed to a temperature of about 320° Fahr.

Detonation, or the firing of explosives by intense shock, is a modern method, for until thirty years ago the application of heat was always used to bring about an explosion. It has now been discovered that detonating produces a more powerful effect than explosion by means of heat. In detonating the wet gun cotton in the torpedo heads, the primer of dry gun cotton which is used weighs only a pound or thereabout. It is placed in contact with the wet mass, which in a Whitehead torpedo consists usually of about 250 pounds. Then by means of a fuse and fulminate of mercury cap, a flame is shot through the disc of dry gun cotton. This explodes instantly, and with it the entire mass of wet cotton, producing tremendous results.

Coast Industrial Notes.

—Union, Or., citizens will build a railroad thence to the Seven Devils country.

—The collier Titania recently loaded 5800 tons of coal in sixteen and a half hours at Nanaimo, B. C.

—The Southern Pacific will shortly begin the extension of the Visalia, Cal., branch to Exeter, twelve miles east.

—Inman, Poulsen & Co.'s lumber raft, containing 5,000,000 feet, is on the way to San Francisco from the Columbia river.

—Twenty-six carloads of fruit were shipped East from Sacramento, Cal., last Tuesday, as against fifteen for the corresponding date last year.

—The Santa Cruz, Cal., Powder Co. last week shipped 120,000 pounds of powder to Manila, of which 100,000 is brown and the balance smokeless.

—A new line of railway is projected from the capital of Mexico, via Popotla, Tacuba, Atzapotzalco and Italnepantla, to Cuatro Caminos.

—The Spanish war is a big advertisement for the country. It will hasten the building of the Nicaragua canal and bring increased trade facilities.

—The proposed line of steamers to be operated between San Diego and Japan will be conducted by a corporation known as the California and Oriental Company.

—At Redlands, Cal., the Lugonia Water Co. has completed a pipe line eleven miles in length at a cost of $40,000. Two hundred and fifty carloads of pipe were used. Eighteen and twenty inch vitrified tile were used for the diverging lines.

—Prof. Haupt of the Nicaragua Canal Commission, before the Senate committee on the Nicaragua canal, expressed the opinion that the canal as proposed was entirely feasible, and placed the cost of construction at between $90,000,000 and $95,000,000.

—The Trail, B. C., smelter will be operated by electricity. Power will be brought from big plant at Bennington Falls. Six new roasters will be installed at the smelter. Forty-eight roast kilns will in time substitute the open roasts, and the fumes will be carried off by an immense stack.

—The agent of the Sierra Railway Co. has been in the vicinity of Summersville, Cal., and it is locally reported that the company, which originally intended Jamestown as its terminus, has, since work began on the Stockton and Tuolumne road, concluded to extend the line to Summersville.

—Solid trains of U. S. government war supplies are now arriving at San Francisco. Last Monday came a twelve-car trainload of projectiles for all sizes guns from 13-inch down. Some will be shipped to the Philippines, some remains in San Francisco, the remainder distributed to coast points.

—A. Smith of Los Angeles, has a Mexican concession to establish a line of steamers between Salina Cruz and Port San Jorge, on the coast of Sonora in the Gulf of California, and to build a line of railroad from San Jorge to the boundary line between the United States and Mexico near the mouth of the Colorado river.

—San Francisco men are prospecting for oil in Rincon canyon, near the dividing line of Santa Barbara and Ventura counties, Cal. Ten carloads of wrought iron pipe and machinery are being delivered at the wells from Carpenteria station, eight miles distant. Should the enterprise prove successful a refinery will be erected at Carpenteria.

—Thomas Marshall of Pittsburg gets the contract for the structural steel work of the new postoffice building at San Francisco. Bids were as follows: Stewart Iron Works, Cincinnati, $179,990; Ed T. Jones, San Francisco, $176,115.87; Risdon Iron & Locomotive Works, San Francisco, $174,875; San Francisco Building Co., San Francisco, $174,875; City Street Improvement Co., San Francisco, $166,000; I. G. Wagner, Milwaukee, Wis., $164,400; McGuire & Hall, New York, $166,498; Thomas Marshall, Pittsburg, $154,715. Marshall promises to have the work completed by March 1, 1899.

—Congress votes to annex the Hawaiian Islands. The population at the latest census was 109,000, of whom 31,000 were Hawaiians, 24,000 Japanese, 21,000 Chinese, 15,000 Portuguese, 5200 Americans, 2250 British and 1430 Germans. The receipts of the Government are about $2,000,000 annually, of which about one-third is gathered by tariff taxes; one-third by internal taxation, and one-third from miscellaneous sources. The U. S. exports to the islands are nearly $6,000,000 this year. The imports in 1896 were $6,063,000, of which about $4,000,000 came from the United States.

—The Manufacturers and Producers' Association of California have issued a directory of the leading manufacturers and producers of the State of California, with an alphabetical and classified list of members. A brief history of the association is also given, including a statement of what it has achieved and what it intends to accomplish, and directs deserved attention to the magnitude of the home market and manifest industrial requirements. The prefatory address concludes as follows: "The suppression of the convict goods calls for action of an earnest order, for this State-aided competition can destroy any industry. The agitation in the Eastern States against this undesirable source of manufacture will have the effect of forcing these goods to California, which has always been a convenient market for them. The Southwick bill now before Congress is aimed to confine the sale of prison-made merchandise to the State or Territory in which it is manufactured, and the vigorous support of this bill is incumbent on every friend of free labor in this State. With honest goods, just traffic conditions and freedom from State-aided competition California's future is beyond all question. The loyalty of our people to California industries must be steadily developed. The efforts of the Manufacturers and Producers' Association have received much criticism from the Eastern press, and have been misrepresented not seldom. There is nothing in the attitude of the association on this question to which the broadest-minded man can honestly take exception. It is the purpose and intention of the association to continue the battle for home industries despite all obstacles." The book merits wide circulation. A copy will be sent upon request addressed to Mr. L. R. Mead, secretary of the association, San Francisco, Cal.

—Discussing oil the Los Angeles, Cal., *Times* says: Shipments to San Francisco do not increase. Some of the large independent producers assign as a reason for this that the large manufacturers of San Francisco have always refused to enter into contracts for the delivery of oil until they could be thoroughly satisfied that the sellers were in a position to fill their contracts. Speaking in respect to this, one of the largest producers in the field said recently: "San Francisco manufacturers would be glad to take all the oil we could deliver to them at 80 cents a barrel f. o. b. Los Angeles, if we could guarantee them a year's supply under contract. But that," he went on to say, "is just where the difficulty lies, for there is not a single producer in the field who is in a position to make contracts of such duration."

—The offices of the Land Registrar and Receiver at Los Angeles, Cal., are busy over 1,000,000 acres land in Los Angeles, San Bernardino and Ventura counties which will be thrown open to location by the United States. This is the property affected by the suit brought by the United States against the Southern Pacific Company some years ago to quiet title. A decision was rendered against the railway corporation and restoration proceedings have now reached that stage where the Registrar of the Land Office is about to advertise the lands and open them up to claimants. A great amount of this country has been sold by the railroad to thousands of settlers, and now all these must prove their claims to the Registrar to prevent occupation by other applicants. A number of town sites have been laid out in this domain.

—The war revenue bill is now a law and all its provisions go into effect next Saturday. The coast will contribute about $20,000,000 annually. The bill is expected to produce $250,000,000 additional expense money for the Government. An expert roughly estimates the details of the increased collections as follows: Beer (increase) $35,000,000. Special tax on occupations, $4,000,000. Tobacco (increase), $25,000,000. Stamp taxes, schedule "A," stock transactions and stock exchange transactions, $26,000,000. Produce exchange transactions, $24,000,000. Documents and instruments, $8,000,000. Checks, drafts, etc., $22,000,000. Freight and express, $40,000,000. Telegraph and telephone messages, $10,000,000; insurance policies, etc., $4,000,000; mortgages, $4,000,000; miscellaneous instruments, $5,000,000; Schedule "B"—Proprietory articles: Medicine, etc., $23,000,000; merchandise, etc., $25,000,000; sugar and oil refining companies, $2,000,000; parlor and sleeping cars, $100,000; legacy and inheritance tax, $5,000,000; tea tax, $10,000,000. Total, $274,100,000.

—A pamphlet on the gold production of the Philippine islands, written by Frank Karuth, president of the Philippines Mineral Syndicate, fully corroborates recent statements of the MINING AND SCIENTIFIC PRESS regarding the gold resources of that region. Mr Karuth says he knows of no other part of the world, Alaska mines excepted, where pay ore is found within a few hundred yards of the anchorage of sea-going vessels. So far the fringe only of the auriferous formation has been touched. There is no brook that finds its way into the Pacific ocean whose sand and gravel do not at least pan the color of gold. Heavy nuggets are sometimes brought down from the mountains. Alluvial gold is also got in the island of Mindanao, especially in the districts of Surigao and Misimis, on its northern coast. Extensive deposits of copper ore in Luzon will probably prove remunerative when means of transport have been devised. The active operations of the syndicate are at present confined to a district in the eastern part of Luzon, and its concessions are scattered over an area of several hundred square miles.

Recent California Mining Incorporations.

Homestake G. M. Co., Tuolumne county; capital stock $250,000, subscribed $25,000; W. Burchett, L. W. McGlauflin, T. Poyzer, I. N. Chapman, W. R. Poyer.

Candalero M. Co.; capital stock $100,000, all subscribed; G. Treat, C. M. Chase, W. C. Pease, A. F. Morrison, R. P. Clement.

Anita M. & M. Co., Ontario; capital stock $480,000, subscribed $384,000; F. E. Trask, I. S. Miller, S. G. Vandergrift, R. C. P. Smith, H. T. Hughes, C. W. Allen, C. F. Allen.

White Oak Mining Co., San Francisco; capital stock, $20,000; W. S. Peters, F. F. Baker, H. A. Melvin, S. J. Conger, J. Henshaw.

The Sixes M. Co., Lakeport; capital stock $100,000, subscribed $85,000; W. P. Butler, C. M. Hammond, W. O. Edmands, R. S. Rodman, A. B. Rodman.

Recently Declared Mining Dividends.

Mammoth, Utah, $20,000; payable June 30.

Sacramento, Utah, $5000; payable June 28.

New Idria Quicksilver, Cal., 10 cents regular and 5 cents extra per share, $15,000; payable July 1.

Modoc, Colorado, 3 cents per share, $15,000; payable immediately.

Elkton Con. M. & M. Co., Cripple Creek, Colorado, monthly dividend 2 per cent, aggregating $556,860; June 20.

South Swansea, Utah, 5 cents per share, $7500; payable July 1.

Gold Coin, Colo., 1 cent per share, $10,000; June 25.

War Eagle, B. C., 1½ cents per share, $7500; payable July 15.

Napa Quicksilver, Cal., 10 cents regular and 10 cents extra per share, $20,000; payable July 1.

Ætna Quicksilver, Cal., 10 cents per share, $10,000; payable July 1.

Personal.

J. S. GOODWIN, a mine owner at You Bet, Cal., is in San Francisco.

J. JONES has resigned as Supt. Live Oak mine, Columbia Hill, Cal.

T. J. HOUGHTON is appointed Supt. Carson Creek mine, Robinsons, Cal.

E. H. WEBSTER becomes Supt. Grand Central mine, La Colorado, Mexico.

EX-GOV. MARKHAM is examining the Alice mine, Perris, Riverside county, Cal.

C. H. DUNTON, Supt. Larkin mine, Diamond Springs, Cal., is in San Francisco.

A. MCDONALD, Supt. Kanaka mine, Groveland, Cal., has returned from San Francisco.

R. E. LINDER has resumed the superintendency of the Red Dog gravel mine, You Bet, Cal.

HON. T. KEARNS, Park City, Utah, is examining mining property in Cripple Creek, Colo.

E. A. ABADIE, Gen. Mgr. Grand Central mine, La Colorado, Mexico, is in San Francisco en route East.

E. A. WILTSEE, San Francisco, consulting engineer London Exploration Co., has returned from Sonora, Cal.

JOSEPH LADUE, who left for the Klondike on the last steamer, takes the first quartz stamp mill into that region.

C. A. HAMILTON of San Francisco, who went to Mexico last December to investigate mining properties, has returned.

E. B. HENDRIE of the Hendrie & Bolthoff Manufacturing and Supply Co. of Denver, Colo., has returned from Europe.

EDWARD N. LINDSAY, who is in charge of the Grand Central M. Co.'s mines in Sonora, Mexico, has returned to San Francisco on sick leave.

SENATOR CHAPMAN, who was appointed a delegate to the Mining Congress at Salt Lake, has notified Gov. Budd of his inability to attend.

THE delegates appointed to the Mining Congress at Salt Lake by Kern Co., Cal., are J. Singleton, J. C. Quinn, C. C. Matthews, W. Bell, W. James.

SAM'L J. HENDY of the Joshua Hendy Machine Works, 40 Fremont street, San Francisco, returned last Wednesday from a business trip to Atlantic cities.

C. E. LOOSE, Mgr. Grand Central mine, Mammoth, Utah, and C. McCormick, are examining mining properties in Amador, Bodie and Calaveras counties, Cal.

CHAS. BUTTERS has arrived in Salt Lake City, Utah, from South Africa, en route to San Francisco. From California he goes on a business trip to San Salvador, C. A.

WALDEMAR LINDGREN has returned from Government duty in connection with timber cases in Arizona, and will leave next month for a season of geologic work near Hailey, Idaho.

THE Siskiyou county, Cal., Miners' Association appointed as delegates to the Mining Congress at Salt Lake B. F. Daggett, M. C. Beem, H. H. Hunter, A. J. Hughes, B. McGill.

MAYOR PHELAN of San Francisco has appointed as delegates to the International Mining Congress at Salt Lake City, Utah, J. J. Crawford, B. T. Lacy, John Daggett and J. F. Halloran.

THE Chamber of Commerce, San Francisco, has appointed delegates to the International Mining Congress at Salt Lake City J. W. Cross, T. L. Ford, W. C. Ralston, G. Stone, W. S. Keyes.

ALEXANDER FORSYTH, A. B., Professor of Metallurgy in the Missouri School of Mines, will occupy the chair of mining engineering and metallurgy in the State School of Mines of South Dakota.

C. B. FINLEY, for many years Mgr. of the Soddy Coal and Coke Co. of Tennessee, becomes Mgr. for the New York company that has purchased the Montana Coal and Coke Co.'s interest at Horr, Montana.

AT the annual meeting of the Pacific Coast Electrical Transmission Association in San Francisco this week, W. F. Pierce was elected president, C. M. Beal vice-president, Geo. P. Low secretary, Wm. Angus treasurer.

C. E. MILLS, who has been Supt. Detroit Copper Co.'s works at Morenci, Arizona, has resigned and gone to San Antonio, Texas, to join Roosevelt's rough riders. Mr. Mills was drawing a salary of several thousand dollars a year, which he abandoned simply because he wanted to fight for the flag.

WM. VAN SLOOTEN, Mem. Am. Inst. Mg. Engineers, New York City, who has been examining properties in Sierra Co., Cal., is on his way East, called thither by the death of Prof. Newberry, consulting engineer South American Development Co., operating in Ecuador. Mr. Van Slooten will return to California.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 14, 1898.

605,466.—LOCK—A. H. Barnes, Reno, Nev.

605,547.—VAGINAL DILATOR—A. F. Holland, Berkeley, Cal.

605,738.—SUSPENDER CLASP.—J. V. Janin, Gold Basin, Wash.

605,728.—BICYCLE BRAKE—D. N. Le Ballister, Fort Bragg, Cal.

605,805.—ROTARY ENGINE—A. Lee, New Whatcom, Wash.

605,611.—SPRINKLING APPARATUS.—A. McGeoch, Oakland, Cal.

605,610.—WINDOW CLEANING SEAT—Muller & Hinman, S. F.

605,612.—BUSHING FOR BARRELS—W. C. Rawley, S. F.

605,615.—ORE STAMP—D. M. Smyth, Pasadena, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WINDOW CLEANING SEAT.—C. A. Muller and Geo. Hinman, San Francisco, Cal. No. 605,610. Dated June 14, 1898. This invention relates to a movable seat or attachment for the outside of windows, which is adapted as a support for persons cleaning windows or performing any other work upon the outside. It consists essentially in a novel construction of the seat and a means for attaching and suspending it exterior to the window with no attachments passing to the inside. The base has metal strips secured across its ends, the inner ends of said strips being turned upward and slotted and adapted to engage and be held by screw eyes fixed in the window seat. Protecting rails extend along at a distance above the seat, with hook bars which engage with eyes or staples in the side of the building, and chains extend diagonally from said staples down to the outer angles of the seat, thus forming a protection to prevent the user from falling. The whole device is easily disengaged by unhooking it and turning the seat up until the slotted bars disengage from the hook eyes.

STREET SPRINKLING, IRRIGATION AND FIRE EXTINGUISHING SYSTEM.—A. McGeoch, Oakland, Cal. No. 605,611. Dated June 14, 1898. This invention relates to a water supply device especially designed to be used for sprinkling and irrigating purposes and extinguishing of fires. It consists of sections of pipes suitably perforated for sprinkling purposes, having the ends turnable in couplings, and a means whereby they may be so turned as to deliver the spray from the pipe at either side thereof and at any desired angle. The device may be fixed along the edges to sidewalks or gutters, or it may be fixed upon the apex of a roof with turnable directing devices to throw the spray to one side or the other and thus protect the roof in case of sparks from other fires.

BUSHING AND FAUCET FOR BARRELS.—Wm. C. Rawley, San Francisco, Cal., assignor to the American Faucet Co. of same place. No. 605,612. Dated June 14, 1898. This invention relates to the bushings and faucet attachments for barrels, casks and like devices. It consists essentially of a permanent bushing, which is fixed into the discharge opening in the containing vessel having an interior valve seat, a second seat formed within the bushing and opposed to the first-named valve seat with a space between the two, a valve movable between the two seats so as to close upon one when withdrawn from the other, and an annular shoulder formed around the inner surface of the removable cap, so as to close against and form a joint with the outer periphery of the inner valve seat. The valve has a tubular stem and openings made so that when it is withdrawn from the inner seat liquid can flow around the valve through openings adjacent thereto into the tubular stem, and thence escape through the faucet barrel, which is provided with lugs and adapted to engage and interlock with corresponding lugs in the outer end of the bushing. At the same time a collar fastened thereto fits a seat and prevents any leakage, while the inner end of the faucet barrel engages the inner end of the tubular valve stem, making a direct connection therefrom to the faucet, and serving, at the same time, to turn the valve to move it away from its seat.

CAN SIDE SEAM FUSING MACHINE.—Jules Gersant, Deal, and A. G. Buttifant, London, England. No. 605,605. Dated June 14, 1898. This invention relates to the class of machines known as can making machines, and the object is to provide a cheap, speedy and effective manner for side seaming the bodies of metal cans, boxes and other vessels and sealing the same. It consists essentially in the combination of a tiltable, cylindrical horn, having a longitudinal slot on its upper surface, perforations on each side, guides on the horn parallel with the slot, the perforated burner pipe inside the horn with tubes attached to the burner pipe and connected with a supply of inflammable vapor, means for tilting the horn, a cylindrical rack bar having a roller attached to its forward end and adapted to press over the seam of the can, and a presser connected with the roller so as to regulate its action on the seam. A mechanism is connected with the device and driving power by which the motion may be reversed.

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence). — It is reported here that the Utica Co. at Angels talks of moving a plant to Plymouth, and that the old Plymouth property is to be reopened.

Plymouth, June 18th, '98.

Record: The Lincoln shaft has been opened about 80 feet, increased in size and retimbered to that depth. The new gallows' frame, hoist, boilers and engines, brought from the Lucile, have been put in position. The hoist is to be operated by steam. There has been no water encountered in the old shaft so far, and everyone seems to think that the property is drained to the depth of 500 feet by the Mahoney, which joins it, and which has been reopened since the Lucille was closed some years ago. If this be so, the work of reopening the property to the 500 level will advance very rapidly as soon as the new hoist is in operation. While cutting out to increase the size of the shaft, some good ore was taken out:

Republican: Sinking is progressing at the Amelia mine, Jackson, as fast as facilities will allow. Supt. Reese is driving for the 700-foot level, but water has interfered with the work to some extent.——At Mason & Griesbach's mine on Pioneer creek operations are proceeding. Gracey's mill is being fitted up preparatory to the crushing of 300 tons of choice ore. ——The Douglas mine, near Volcano, Supt. Triniman, is at work in the old shaft, which is about 400 feet deep. Twenty men are employed.——The Wieland mine, at Pine Grove, which for several months has been in a doubtful position, settled the delinquent April payment. The May payment will probably be paid soon.

Dispatch: Work at the Anita, Jackson, progresses; the shaft is now down nearly 700 feet. The rock is hard and work necessarily slow. ——Folger & Adams have bonded the Peeming land near the Zeila mine and will soon begin development work.

Butte.

Mercury: A large force is at work fluming Butte creek near Lovelocks.——The Best mine, near the forks of Butte, is running under the management of A. Jurgenson. ——Moody & Reily are running a tunnel on the Yellow Jacket mine, near Nevinsville. ——A strike is reported on the McCally property.——The old Dix mine is running a large force. B. Diller is Supt.——The Ohio mine is running with good results.——C. S. Quimby has sold his placer mine near Biggs to Corwin & Wheeler of Oakland.

Calaveras.

(Special Correspondence). — The California Exploration Co. has purchased the Thorpe mine near San Andreas.

The old Sheep Ranch mine is soon to be reopened. It is locally stated that the company will install electric power, securing it from the plant the Utica Co. contemplate putting in at Murphy's.

The Bonanza gravel mine at Murphy's has begun work which will be diligently pushed.

Murphy's, June 18th, '98.

Citizen: The California Exploration Co. discontinued operations on the Bund mine, near San Andreas, and Supt. Honnold expects word to assume charge of the Thorpe mine.——The new company incorporated to work the old Sheep Ranch mine has purchased the San Antone water ditch.——At the Gwin mine, near Mokelumne Hill, the old shaft is cleaned out to 1320 feet. So far the work in the old shaft has been very satisfactory. The new shaft is producing and the mill is running regularly. A full force is employed in each department.

Amador *Republican*: D. Gutmann has a bond on the Sheep Camp mine, which embraces several other mines and over 400 acres of timber land.——In the Harris mine, near Los Muertos, a strike of good ore is reported at a depth of 130 feet. The ledge is 8 feet wide.

Del Norte.

The Mettah Bar M. Co. operating on the Klamath river near Blue Lake has completed six miles of ditch and put in two giants. They intend putting in a hydraulic elevator preparatory to beginning work next autumn. They will have 240 feet pressure and 35 feet lift. The bar comprises four acres. The Supt. of the company is A. B. Campbell of San Jose.

El Dorado.

(Special Correspondence).—The Esperanza mine at Garden Valley milled about 1000 tons of ore that is said to have yielded $4 per ton. They pulled the pumps and shut down.

The Taylor mine has ceased operations awaiting the second installment on the purchase price. The pumps are in operation and the mine is kept clear of water.

The Union mine near El Dorado is running twenty stamps, twelve hours out of twenty-four.

The new 20-stamp mill at the Griffith Con., Diamond Springs, is to be completed August 1.

J. C. Diamond has cut the ore body on the 200 level, referred to in my last letter, and finds it to be 12 feet wide. It is good milling ore and some of it is quite rich.

The Gravel mine at Grizzly Flat runs ten stamps only twelve hours out of twenty-four because water is scarce.

I am reliably informed that the Gwin M. Co. have secured the old Havilah mine owned by Hendy of San Francisco and will reopen the property. It is at Nashville, about thirteen miles southwest of Placerville.

Senator Voorheis and Supt. Thomas were in Nashville examining, it is said, the Montezuma property and negotiating for additional ground.

The company operating the Newton gravel mine, six miles east of Placerville, failed to obtain favorable extension of bond, and finding their development work a loss they ceased operating. The property has a 10-stamp mill.

The Big Canyon mine operated by water from the Park Canal expects to be able to continue operations into July. The water supply is growing less throughout the county.

The Boulder mill near Shingle closed for the season on account of lack of water.

Development of mining properties is carried on in this vicinity to a greater extent than at any time in the history of the county.

Placerville, June 21st, '98.

Williams & Harpending are adding twenty stamps to the twenty in operation on the Union mine, near El Dorado.——Grizzly Flat mining interests are suffering from shortness of water.——The Eagle M. Co. at Grizzly are building a 10-stamp mill.

Georgetown *Gazette*: The Two Channel gravel mine is running and keeping the 10-stamp mill at work night and day.

Democrat: The mill at the German mine, near El Dorado, is running day and night, with twenty-two men employed and an abundance of pay ore.——They are still sinking on the Roberts mine near Lotus, and at a depth of 80 feet are getting out some high-grade ore, which is being shipped to the Selby Co.——Schiff & Limpinsel have struck a quartz ledge on Bear creek, in the Slate Mountain district, from 12 to 15 inches wide, that bids fair to prove valuable. From samples tested the yield was $100 to the ton.——A strike of rich value has been made at the Limpinsel mine near Placerville. At the 260-level a crosscut was run 20 feet, where the ledge was struck. The ore is highly sulphureted with gold plainly discernible. They have 10 feet of ledge matter, with the hanging wall yet to reach.

Gazette: The quartz locators on the Crane's Gulch placer patent, near Georgetown, will be forced to defend their claims in the courts.

Nugget: Work is progressing on the Boneset tunnel, Webber Creek district. The tunnel is in 160 feet. Hayward & Lane have a bond on the property.——The custom mill completed an eight-ton run on ore from the old Stuck Slager mine near Lotus. The result was satisfactory.——Root & Carey continue development at the Columbia mine near Cold Springs. A pumping plant has been put in and the shaft is down 90 feet.——At the Houx mine near Shingle Springs the shaft is over 100 feet deep.——On the Crown Point mine near Diamond Springs the shaft has reached 175 feet; a tunnel is being driven on the ledge that will connect with the shaft at a depth of 205 feet. Twenty-seven men are now employed.——A number of men were laid off at the Boulder mine near Shingle, owing to the shut down of the mill for lack of water. The sinking of the new shaft from the tunnel level is continued; it is down 205 feet. The work of breaking ore will be continued until the ore bins have been filled.——It is reported that the Unity mine near Granite Hill, which was closed down in November, will soon resume operations.——J. Melton contemplates installing either an electric or air-compressor plant on the South Fork of the American river to operate the Joe White mine. The plant will be about one mile above the mine.

Kern.

Los Angeles *Review*: The Black Hawk at Randsburg is working twenty men. The ore milled paid a good margin.——At the Eureka 2-stamp mill they cleaned up a run of sixteen tons of ore for the Sunshine, which produced $1950; six tons from the Santa Ana produced $735; twelve and three-fourths tons from the Kinyon produced $2165. They are milling thirty tons for the Butte that will average about $80 per ton. During the past thirty days they have milled about 200 tons of ore of the average value of $70 per ton, or $14,000. ——The Yellow Aster M. & M. Co. have sixty men working. They are preparing to ship to Barstow.

The Rand mine near Johannesburg has over 700 tons of ore in its bins and has begun shipping fifty tons a day to Barstow. Five stamps are still running at Garlock on Rand ore.

A big dump of refractory ore at Duval's mine beyond Garden Station in the Rademacher country will be shipped to Barstow. ——The engineers have completed the first survey of the route from Kern river to Randsburg for the establishment of the electric power line.——The Golden Rule mine near Randsburg, a new one, is showing up well. ——The Ophir mill at Cuddeback lake made a run of two and one-half tons of ore from the Santa Ana mine which turned out $140.

Mariposa.

(Special Correspondence).—At the Compromise (Marble Springs), the compressor has been started and air drills are now in use in the stope. The ore body in the new shoot, which is 4 feet in width and at the last clean-up milled about $15, is improving with depth and occasional streaks are encountered, which recall the bonanza days of the mine. The mill will shortly be started up again, being supplied with water pumped from the old workings.

The Virginia mine and mill have been closed by reason of short water supply. While a small amount of water remains in the storage reservoir the management reports that its use for condenser and compressor purposes has heated it to such a degree as seriously to interfere with amalgamation. The average of the ore milled during May and to date in June is understood to have been about $15, and the stopes on the lowest (400) level show considerable bodies of much higher grade rock. The closing of the property throws about thirty-five men out of employment till the fall rains.

The Tendron Company at Whitlocks have recently encountered a new body of good milling ore to the south of the present shoot in the lower workings.

At the Big Betsey, above Coulterville, twenty men are employed. Drifting is going on in both directions from the bottom of the shaft on the 200 level.

The Fresno company operating the Contention at Bull Creek has taken an extension of its bond for one year for further exploration.

The bond held by F. H. Hill on the Porter mine adjoining the Malvina and Tyro on the south has been allowed to lapse. Negotiations are in progress for re-bonding the property at an increased figure.

At the Mary Harrison mine of the Merced Company the station is being cut at the 700. Drifts from the old workings have been connected through to the shaft on the 500 and 600 levels, and the enlargement of the shaft to three-compartment size is completed. The winze has reached the 700 level and drifting toward the shaft has begun. The high grade streak of ore is again reported at this depth. The engine and boiler house at the Louisa shaft have been taken down, and together with the engine (one of the largest in the State), will be erected at the Mary. Water is scarce and all available men are laying a pipe line from the mill on Black creek to the mine. The distance is two miles and water will be pumped to supply the Mary Harrison till the fall rains set in.

The Louisiana mine and mill are operating as usual.

Preparations are under way for an unusual amount of river mining this season on account of anticipated low water.

Mariposa, Cal., June 20th, 1898.

Mono.

Chronicle: Supt. M. W. Nelson expects to start up work at the Jordan mines, the Goleta, Montecito and Sterling, near Lundy, about the 24th. The mill will be started for a permanent run, as Supt. Nelson is now assured the ores of these mines can be worked with satisfactory results.

Napa.

The Napa Consolidated Quicksilver Company issues the following statement for three months to June 1st: Gross receipts, $57,600; charges, $32,649; net, $24,951; dividend, $20,000; surplus, $4,951.

Ætna, four months to June 1st: Gross, $39,600; charges, $26,827; net, $12,773; dividend, $10,000; surplus, $2,773.

Nevada.

Drifting north and south on the ledge from the 1200-foot level at the Mountaineer mine, near Nevada City, is in progress. The ledge is about 6 feet wide.——At the Chapman Ranch mine the 5-stamp mill is kept busy on good ore.

The old Ben Franklin group has been bonded to Boston men, who will begin development. It is one of the oldest quartz mines in the State, but has never been worked below water level. It has produced nearly a quarter of a million dollars.——Grading for the 300 H. P. compressed air plant, to supply the Central mines with power, has been commenced, and within the next four months Supt. Foote expects the plant to be in operation. On future developments will depend whether or not a new hoisting and pumping plant, as well, will be erected at the Central. The shaft is down 530 feet.——The Massachusetts Hill shaft is down 1400 feet on the incline; sinking continues. There are about 200 men employed on day's pay and contract, who keep twenty stamps of the North Star mill in operation.

Union: D. Voss will reopen the old Lecompton quartz mine near Nevada City. The old shaft will be cleaned out and sunk a few hundred feet deeper.

Herald: The Eagle Bird mine, at Maybert, is working a small force this month, water being scarce.

Transcript: W. T. Phipps, Mgr. State Anti Debris Association, has lodged complaint with the U. S. Debris Commission against the Kate Hayes M. Co. and others.

Union: The new 10-stamp mill on the Gaston Ridge property near Graniteville will be completed, says Supt. Harmon, about July 10. He will then run twenty stamps day and night.

Placer.

The statement of the Pioneer M. Co. for May is as follows:

Tons rock crushed	630
Men employed	50
Average value rock	$13.77
Value gold bars	8,676
Pay roll	4,238
Bills	1,226
Total expenses	5,465
Net earnings	3,211

Water at the mill has been very short all the month; some of the time ten stamps only were running, and they very slowly. The construction of the dam and flume is progressing very satisfactorily, the low water in the river offering a favorable opportunity for doing the work. When this dam is completed a regular monthly product is assured, and it is further expected that sufficient power will be obtained to run twenty more stamps, and when these expectations are realized the stamps will be added and the product should be doubled. This completes the twelve months during which the management has reported monthly operations. During this period the gross earnings were $142,995; 9051 tons of rock were crushed, which averaged $15 80 per ton; $25,000 was paid in dividends and $47,069 carried to surplus account. The company earned 7.2 per cent on its $1,000,000 stock. Dividends are now being delared at the annual rate of 5 per cent.

Leader: It is locally reported that the Van Avery mine at Blue Canyon, which had been bonded by a Des Moine, Ia., company, has been bought by that company and work of increasing milling facilities will be begun shortly.

Herald: Senator Chapman is rushing work at the Golden Rule, near Auburn.——A good strike is reported from the Jubilee mine at a depth of 100 feet.——J. Malmberg is keeping his 5-stamp mill going steadily.——The hydraulic mines at Gold Run have closed down for the season.

Sentinel: The tunnel at the Azelea mine, Blue Canyon, is in 950 feet and the quartz is improving.

Plumas.

The *Independent* reports the discovery of a bituminous coal vein near Genesee Valley.

National-Bulletin: J. E. Remick of Taylorsville has begun hauling quartz from the Lucky S. mine to the mill for a crushing.——Thomas & Flanagan have a good quartz prospect at the Bell mine, near Quincy. They are said to have a ledge of from 3 to 4 feet. The ore is being hauled to the Wormley arrastra.——Mr. Allen is doing development work on the Bushman quartz mine, near Butterfly. It is said that a mill will soon be erected.——The late rains have increased the supply of water at the Bean Hill and Plumas Imperial hydraulic mines. A small force is employed at each mine.

Riverside.

Further work on the Leon mine has been postponed.——The Iron Chief employs sixty men in development and construction work. The shaft is down 265 feet. The mill and cyanide plant will have a capacity of sixty tons per day.

San Benito.

The New Idria Quicksilver Company issues the following statement for four months to June 1st: Gross, $61,200; charges, $22,850; net $38,350; dividend, $15,000; surplus, $23,350.

San Bernardino.

Development continues on the properties on which tin was discovered in Holcomb valley. ——The dry year is profitable to the men working dry washers.——Matheson & McComb continue development on their copper property. They are said to have a fair-sized vein.——At Virginia Dale M. Furguson is putting up a 5-stamp mill, and will mill ore from his White Star and Standard mines, from which he has 500 tons on the dump. The work on these mines consists of a 1400-foot tunnel and a 140-foot shaft. They have a 4-foot ledge of good grade rock. St. German & Coolidge in the Ivanhoe mine have a shaft 130 feet deep and 200 tons of good rock on the dump. The Evening Star mine has out about 100 tons of good ore.

Los Angeles *Express*: The new reduction works at Barstow have started up and 200 tons of ore run through the mills. It is expected that it will take about a week to get everything running in proper shape, when the works will be able to take care of all ore consigned to them. Five cars of ore were shipped in from Randsburg. It is believed there will be no difficulty furnishing ore to keep the works running at full capacity.

San Diego.

(Special Correspondence).—A strike of free-milling ore is reported in the mine of R. Gardner, between Julian and Stonewall.

In the Washington mine, near Julian, a valuable ore chute has been encountered, after months of patient work.

The Ranchita at Banner reports another and still richer discovery. It has for a long time been a steady producer.

The Helvetia, between Julian and Banner, is attached by the miners, who demand pay for their services.

In the Mountain View, near Cuyamaca, the free ore chute continues better as depth is gained, and recently a sulphuret ore has come in nearly alongside the free ore but not allied with it. The value of the sulphurets has not yet been ascertained.

Lawyer Holland made a 100-ton crushing of ore from his Eleveda mine by the Ranchita mill, which gave him a twenty-pound brick—a value of over $5000.

The Schilling Ranche mine, patented, between Stonewall and Julian, has been bonded for ninety days for $10,000. Eastern capital is investigating. The ledge varies between 16 inches and 10 feet in width. Some good assay returns have been made.

San Diego, June 17th, '98.

The Richmond, near Julian, has started with a full force and has 1400 tons of ore.—— The Bailey Bros. have their ten-stamp mill running.——The Ventura M. Co. has about thirty tons of ore on the dump.

Shasta.

A ledge has been found near Muletown that assays well in gold and silver and 37 per cent copper.

Temporary injunction is asked in the United States Circuit Court in the name of the United States to restrain the Mountain Copper Co., Ltd, from roasting their copper ores in the open air near Keswick, the suit being for the preservation of the timber. The complaint claims that the smoke can be condensed and innocuous to vegetation.

Courier: G. C. Carson and others have purchased the La Plant mine near Keswick and put men at taking out ore.——The developing work on the copper prospects on Stillwater is being prosecuted and the outlook is encouraging. In one of the shafts high grade black sulphide of copper ore has been penetrated. ——Copper ore was discovered on the claims on Stillwater of Bryan & Dittmar.——W. W. Wright has purchased the Brunswick mine near French Gulch for $30,000. The property has a 4-stamp mill, to which twenty stamps are to be added.

Siskiyou.

In the Pitz mine at Oro Fino a small-sized ledge has been found that assays from $75 per ton upwards.

The American Bar M. Co. near Hornbrook are moving machinery to begin work on a fourth pit. They have already worked out three large pits this season.

At Oak Bar is the largest wingdam on the Klamath river. The length is 12 feet by 200 feet wide. The dip wheel is 24 feet high. The size of the flume is 14 and 16-inch sides and 20-inch bottoms, and has a length of 1400 feet. The length of pump shaft is 260 feet and the size of the pump is 6x24, 32 feet long and capable of hoisting 60 miner's inches of water per minute.——The Blue Gravel mine

near Yreka realizes from $300 to $400 daily, the expense of running the mine is $100 per day.

Journal: H. J. Barton has built a wingdam, with head and foot dams, near Oak Bar, covering a distance of 1400 feet in length. A claim worked out in pioneer days by Kleaver & Co., near by, yielded over $80,000. The Distlehorst & Barton dredge is running day and night at mouth of Horse creek, Klamath river, with excellent success lately. Over $500 was taken out last week, and the operators feel confident of doing still better as the claim is more fully opened in the pay channel. ——The Eastern company interested in the Yreka creek mining enterprise has men at work with apparatus for prospecting the ground in the vicinity of Hawkinsville, to continue up to Yreka, at a distance of 200 yards apart. The machinery is of the boring style. If everything proves satisfactory dredging apparatus will be introduced in working the creek and taking the ground bonded for mining purposes from below Hawkinsville to the northern line of Yreka Hickey Bros. purchased a half interest in the Esmerelda quartz mine near Sawyer's Bar for $2000. There is said to be a 4-foot wide vein in this property that averages from $75 to $100 gold per ton.

Sierra.

Fifteen tons of machinery for the Gold Bluff quartz mine near Downieville are on the way to the property.—F. G. Lowe had seven tons of ore crushed from his mine near Pike City which yielded $136 gold and $20 a ton in sulphurets. The ledge is 12 inches thick.

The Grass Valley *Union* says work will be commenced immediately installing compressed air plant at the Plumbago mine. The plant will be located on the middle Yuba river, about 4000 feet below the mine. The air will be transmitted to and reheated at the mine. It is estimated that it will cost in the neighborhood of $10,000 to install the plant. The Supt. of the mine is M. W. Mather, Alleghany P. O., Cal.

Trinity.

Craft & Flake shipped $1200 gold bullion from their quartz claim on North Fork of Coffee creek.——The McKinley M. & M. Co. have seven men at work on a quartz property near Trinity Center. They expect to start crushing ore in thirty days.

Reporter: At the Cinnabar shaft and tunnel 250 men are reported at work and fifty are to be added July 1st.——At New River work has been resumed on the Grover Cleveland mine.

Tuolumne.

In the Arbona mine, Tuttletown, the shaft is 230 feet, and drifts on two levels have a total of 353 feet. The company contemplates sinking 1000 feet. The vein is 4 feet wide. The quartz contains 5 per cent sulphurets assaying $40 per ton. The ore is said to run from $12 to $15 per ton.——The Santa Ysabel at Quartz mountain has two 300-foot vertical and one 600-foot incline shafts. The veins run from 5 to 15 feet. There is a 20-stamp mill on the property run by electricity.——B. M. Ford has bonded to Stockton capitalists 120 acres near Quartz mountain for $20,000. Development work will begin in August.

Union Democrat: At the Grizzly, near Carters, general development work is being done, and indications point to a prosperous future. On the 280-foot level a drift is being driven for the shaft of the old workings. The work of raising ore was commenced last week, and the bins are full, with much more blocked out. The new 20-stamp mill made its initial run. W. Sharwood is Supt. The mill has a crushing capacity of 1500 tons per month.——Supt. E. D. Dell has a small force at work on the Belleview, near Sonora. The depth reached is 760 feet.——The Gerrymander, near Sonora, is drifting on the 100 level and is in good ore.

NEVADA.

Pumping was resumed at the Chainman mine and the largest stream of water ever raised from that mine is coming down the canyon. The mill began the crushing of Jupiter ore, and when this has been disposed of it is expected that work will be resumed in the Chainman.

It is said the Gold Creek Company's placer mines at Gold Creek have again been closed down.

At the De Lamar mine 300 tons of ore daily pass through the mill. The steam wagon, which has experienced some trouble getting through the sand, will have its tires enlarged to 16 inches across the arc.

The White Pine *News* says that the sale has been made of the Star and Grey Eagle mines at Cherry Creek by the Florence M. Co. and A. C. Cleveland to the Adelaide Star mines, limited, a corporation whose office is in Glasgow, Scotland, for $182,250. A large mill is contemplated.——Developments in the North Mountain Co.'s mines at Cherry Creek are uncovering good bodies of high grade gold quartz.——The Independence and Elra mines at Tuscarora have been consolidated and will hereafter be worked under one management.

Pioche *Record*: The operations of the new company at Ely have not progressed beyond the trial stage. The ore is low grade, $12 rock being regarded as fair.

OREGON.

Work on the River Junction placer mines of the Co-operative M. Co., in Jackson county, Watkins district, is developing satisfactorily. At bedrock on the channel they are said to be getting 14 cents to the pan.

A. Underwood of San Francisco has purchased the Hamersly mine near Wimer and begun work.

At Baker City ore is being delivered from the Collateral mine to the mill on the Virtue mine. If the first cleanup shows as well as the assays work will be continued.——The cyanide process used by the Oregon Gold Extraction Co.'s plant at Ashland is giving satisfaction and the company will extend its plant. They have worked only a small portion of the tailings of the Ashland quartz mill.

Grants Pass *Journal*: Great things are promised from the development of the lodes in the Mt. Reuben district, near Grants Pass. The Gold Bug mine, in which it is said a million dollars' worth of ore has been exposed, will shortly pass into the hands of Senator Jones and associates of Nevada. These men will erect two 20-stamp mills and 200 men will be given employment within six months.

Ashland *Tidings*: The Ashland mine shipped a carload of ore and one of concentrates to the smelter. The mine also made a cleanup of 160 tons with satisfactory results.——Senator Jones it is said will build a 20-stamp mill on his mine in Mt. Reuben district.

WASHINGTON.

The Indian appropriation bill now pending on the conference report retains an amendment making the mineral lands in the Colville Indian reservation subject to entry under the mineral laws, the lands allotted to Indians or used by the Government for any purpose or by any school being, however, exempt. This amendment applies to the southern half of the reservation, and another amendment retained provides that the lands allotted to Indians or used by the Government or any school on the northern half shall not be subject to entry. The right is granted to cut timber for mining or domestic purposes on the allotted lands of the northern half, and the Secretary of the Interior is directed to compel allotments on that half on the surveyed and unsurveyed portions.

The Republic mine at Republic is reported bonded to a British-American corporation for $3,000,000.

Work will shortly be resumed on the Sunday mine at Meyer's Falls, a recent shipment of eight tons yielding good returns.——A strike is reported on the Bryan & Sewall at Republic of a body of ore 25 inches wide containing silver, lead and copper.——The Supt. of the Quilp let a contract for 100 feet of drift to be run.——Twenty bids were submitted for the contract, ranging from $5 to $8 per foot.

At Curlew lake work is shortly to be resumed on the Lame Foot group, owned by J. Goetz and others of Spokane.——The Republic mill is to install additional crushing machinery.

It is reported that the Chloride and Rattler properties, near Fruitlands, have commenced shipping.——The Double Standard mine at Northport is again being worked.——C. Knutson of the Great Republic mine at Northport will put $10,000 in this property in pumps and the necessary machinery for the further prosecution of development.

Spokesman-Review: A 12-foot wide ledge has been found in the Red Top mine, near Boundary. The ore carries gray copper chlorides and galena.

BRITISH COLUMBIA.

Naden & Hallett have sold the Fourth of July claim in Greenwood to the Old Ironsides Co. for $3000.——Twelve hundred and thirteen tons of ore were received at the Trail smelter during the past week from the Rossland mines. The War Eagle sent 976, Iron Mask 80, Monte Cristo 125 and Center Star 32.

Rossland *Miner*: The Golden Gate and the Jennie Lind, two copper properties near Hall's Siding, in the Ymir district, have been sold to F. L. Mercer for $7000 cash. He also purchased the Dodo, in the same country, for $1700.——The machinery for the compressor plant for the Noble Five, in the Slocan, will be installed at once.——A force has been put on at the Canadian group and work will be pushed.——The Payne shipments have been curtailed during the last ten days on account of an accident on the tram.——D. G. Eaton returned to Nelson from San Francisco, where he went with a shipment of ore from the Silver Cup mine. It consisted of 350 tons and was consigned to the Selby smelter. The returns were favorable, the ore averaging 200 ounces of silver and $12 in gold to the ton. The Silver Cup is being operated by the Sunshine M. Co., commonly called the Horne-Payne syndicate. Since last September about 800 tons of ore have been mined and sacked, but only 350 tons of this was shipped, as it all had to be hauled by teams or rawhided twenty-four miles to Thompson's Landing, on the Arrow lakes.——The Silver Bell shows a lead 10 feet wide assaying $41 in gold and thirty ounces silver.

Over 100 men are working in Greenwood and Wellington camps.——It is reported that the Royal Banner mineral claim in Summit camp has been bonded to an English company for $30,000. Of this amount $1000 has been paid in cash.

Rossland *Miner*: The Corbin block of Virginia stock has been sold to the Mackay combination, which now holds control of the property. The sale included 122,595 shares at nearly 36 cents a share, amounting to over $43,000. The sale was cash. The same company also holds the control in the Monte Cristo property.——From Sandon, between August 1st of last year and May 27th last, were shipped 22,993 tons of Slocan ore. Of this the Payne mine accounted for 10,010 tons, the Ruth with 5374, the Slocan Star 3247, the Idaho 1864, the Last Chance 1384 and the Reco 1128 tons.——The Channe M. Co. at Fairview has received returns from trial shipments made to Liverpool as follows: Tangier mine, ten tons treated, gave silver, 94.39 ozs. per ton; gold, 0.339 ozs.; copper, 5 60 per cent net; lead, 28¾ per cent. Waverley mine, further shipment of seven tons, yielded gold, 0.163 ozs. per ton; silver, 21.88 ozs.; lead, 26¼ per cent; copper, 5.06 per cent net. Two cars of seventeen tons each sent to the smelter gave the following returns: First car, gold 0.10 per ton; silver, 59 ozs.; copper, none; lead, 17.2 per cent. Second car, gold 0.16 per ton; silver, 593 ozs.; copper, none; lead, 19.2 per cent.

News-Advertiser: In Barkerville district, Cariboo, the starting of the large hydraulic elevator of the Cariboo Goldfields Co. was attended with success. The plant is on the old Marysvale ground. The lift is 90 feet; the pressure is 650 feet. There are many places in Cariboo situated to the Goldfields property, and the success of this method of working the deep ground will be of great benefit to the district.

ALASKA.

The Alaska-Treadwell mine reports for May as follows: Ore reduced, 22,266 tons; sulphurets, 314 tons, latter yielding $11,968; bullion produced, $42,389; gross expenses not given; average ore, $1.90 per ton.

The Alaska-Mexican mine for May reports as follows: Ore reduced, 12,956 tons; sulphurets, 347 tons, latter yielding $11,981; total bullion, $40,992; gross expenses, $24,249; average ore, $3.16 per ton. The report of the same mine for the fiscal month of June was as follows: Ore reduced, 13,931 tons; sulphurets, 262 tons, latter yielding $10,947; bullion produced, $40,051; gross expenses, $20,332; average ore, $2.88 per ton.

The first mile of track of the first railway in Alaska was laid through Skaguay on the 22nd inst.

UTAH.

Park City was almost destroyed by fire last Sunday. The loss aggregates $750,000. The entire business portion of the town was consumed.

Assays from the Star, in Pine canyon, show sixteen ounces silver and $7.40 in gold.——From Alta shipments from the City Rock and Grizzly were made to the smelter.——A shipment of cyanides from the Northern Light consisted of 106 pounds, from which $501.31 was derived.——At the Nigger Baby the vein has widened to 18 inches and the values of the ore run from $28 to $35, chiefly silver.——Samples of ore from the Copper King mine at Alta assay from 10 to 40 per cent copper, and active work will be prosecuted throughout the season.——The Richmond and Theresa, in the same camp, have been leased by men who will begin work at once.——A lease has been closed on the Read & Benson ground which has been productive of much ore in former years.——Eight cars of silver and lead ore were shipped from the Niagara at Bingham.——The first shipment of ore has been made from the Bemis lease on the Spanish at Bingham. It carries silver and lead, with a fractional amount in gold.——A carload of ore from the West Argent at Stockton shows forty-five ounces silver and 45 per cent lead.——The new strike in the Hercules averages thirty-four ounces silver and 50 per cent copper.

The report of the South Swansea at Silver City this month shows the property in good condition. A trainload of ore is being prepared for the market, while new depths are being prospected; the ore, it is said, maintains a uniform grade and affords a good margin throughout the various levels.——In the Grand Central, at Mammoth, ore bodies are increasing and everything shows a steady increase in the output. The company is negotiating for an electric plant and it will be installed as soon as the company decides at what point the sinking of the new shaft will begin.——At the Ajax mine work on the shaft is progressing with satisfactory results. It has reached 65 feet below the 400-foot level. Meanwhile the management is marketing sufficient ore to meet the requirements of the pay-roll.——The mill on the property of the Ophir Hill Con. M. Co. at Ophir has started up and will continue as far into the season as the volume of water will permit. The starting up of the plant provides employment for thirty-five men between the mine and mill, through which 100 tons will be put daily, the concentrates going to the smelter.——The Marsac mill at Park City is working the tailings of the Ontario mine. They afford a good margin, and in the opinion of many the ore bodies in the mine can be made to respond with a dividend any time the company decides to call upon them.

The good returns of the Silver King under the management of T. Kearns, are approximating those of the productive days of the Ontario and Daly, while at the Anchor Mgr. Keith is accomplishing results far ahead of any that have been hitherto recorded.——At Fish Springs the Utah is taking out ore.——A strike of lead ore is reported from the Addie Bell.——The Galen M. Co. made a shipment of high grade silver and lead ore.

At Lion Hill the initial shipment of high-grade ore from the Columbia has been made.

The *Miner* reports the shipment from Tintic of sixty-two cars of ore, ten cars of concentrates and thirteen bars of bullion.——Samples of ore from the Orient in West Tintic from a new strike show fifty-six ounces silver, 20 per cent lead and $13 in gold per ton.

Tribune: Unwilling to meet the advance in treatment charges Pres. Beck of the Bullion-Beck M. Co. at Eureka says that the marketing of ores from the property will be stopped and the output held at the mine until a desirable contract can be entered into. The smelters, he says, are making exactions to which he cannot consent, and while he would like to see the mine continue among the shippers, he is not willing to have it do so at a sacrifice to the stockholders.

Of the Bullion-Beck he says it has rarely looked as well as at present. The ore bodies some time ago uncovered in the winze are large, and when connections are made between them and the 1300-foot level, will be raised at a greatly reduced cost.——Samples of ore from the Homestake at Silver City show a heavy percentage of copper. The ore occurs in streaks at a depth of 500 feet in the shaft.

Tribune: That the directors of the Mercur M. Co. will at their next meeting take definite steps toward the erection of the long-projected mill at the mine has been given out as a fact. It is said the capacity of the projected plant will be not less than 300 tons daily with which to start, while provision will be made in the construction of the foundation for at least double that tankage.

Mercur *Mercury*: Col. Heffron, who secured a short-time bond on the South Daisy a few weeks ago, has made the first shipment, aggregating $11,000. He has men at work on the property and good results are being obtained.——The owners of the Mercur mine were $12,000 in debt before they adopted the cyanide process. Since then they have a large sum in dividends.

IDAHO.

(Special Correspondence).—The Silver City district is south of the Snake river, in Owyhee county, seventy-five miles south of Boise, at an altitude of about 6300 feet above sea level. The mines here were discovered in 1863 and in early days Silver City was the principal point on the pioneer trail between Boise and Winnemucca. The town itself is situated on Jordan creek, between War Eagle and Florida mountains. The discovery and development of the noted mines on these two mountains and the growth of the town are closely interwoven with the history of southern Idaho.

The Boise, Nampa & Owyhee Railroad has been built within the past year from Nampa, on the Oregon Short Line, to Guffey, on the Snake river. From Guffey to Silver City and DeLamar the old stage conveyances and freight wagons are still required.

The oldest property in the camp is the Poorman, which is on War Eagle mountain, and was located in 1865. It comprises eighteen claims and is credited with a production of $6,000,000. In 1866 it produced ore which milled an average of $229 per ton. The cost of production was then $66 per ton. The property was practically idle from 1875 to 1888. From the latter date to the present time it has been in the hands of and worked by a London company. A reorganization was effected in 1895 and a 10-stamp mill built, with a one-mile tramway from the mine to the mill. Present workings extend 250 feet below the main level and 900 feet below the apex of the vein. The old workings, above the main level, are practically abandoned. The principal vein is cut by a crosscut which runs from the main level on a parallel vein. The length of the main tunnel is 2000 feet. They are now in a body of ore which is being milled at the rate of ten tons a day. The mill includes stamps and screens and Pelatan-Clerici treatment vats. The ore is a gold-bearing quartz, with some silver. Richard H. Britt is Supt. and Frederic Irwin consulting engineer.

The Trade Dollar, which has been under the superintendence of James Hutchinson since May, 1894, is on the south side of Florida mountain and has three miles of trackage, five miles of tunnels, drifts and levels, connecting with the Idaho & Pittsburg tunnel on the opposite side of the mountain. It is equipped with a 10-stamp pan amalgamation mill, which ran 359 days in 1897, crushing 8975 tons of ore in that time, which ran $60 per ton, yielding $538,500. Besides this product, ores of the value of $196,500 were shipped direct to the smelters, making a gross output for 1897 of $735,000, the net profits, in round numbers, being $420,000. Smelter shipments thus far in 1898 have given very high returns. As an example, one shipment of 23,921 pounds brought $44,185; a shipment of 25,412 pounds yielded $24,648; another of 24,797 pounds brought $24,225. The shipments to the smelters average two cars per month. The mill is crushing an average of twenty-five tons per day. The product is about one-third gold and two-thirds silver. The Trade Dollar is the property of Pittsburg capitalists.

The Idaho & Pittsburg M. & M. Co. own and operate the group of properties on the north side of Florida mountain locally known as the Black Jack group, whose claims end line with those of the Trade Dollar, the underground workings of the two properties connecting. This property also belongs to Pittsburg parties—not the same, however, as those who control the Trade Dollar. John Irwin Jr. is president, Edwin Bindley vice-president, James MacKay treasurer, Lloyd L. Little secretary and Frederic Irwin Supt. The Black Jack was opened in 1890 by an 800-foot crosscut to the ore ledge. From this point a drift on the ledge extends 1500 feet. A vertical shaft is down 236 feet from the twelfth level, crosscuts being run at 100-foot stations. The main two-compartment shaft follows the hanging wall. The development includes 2000 feet of crosscuts, 1400 feet of levels, and 4000 feet of drifting on the ledge. The company has on the ground a 10-stamp, wet crushing, combination mill, with four vanners, eight pans and four settlers. The mill averaged twenty-eight tons per day for 1897, operating 360 days. It has been in continuous operation for five years. Sixty per cent of the product is saved in the concentrates, the balance of the saving being from the amalgam pans. The ore is a medium-hard quartz, carrying sulphide of silver and free gold. The ore runs from $30 to $40 per ton, and it is stated over 90 per cent of the values are saved.

The Cumberland group, on War Eagle mountain, owned by James Shaw, is being worked under bond and lease to Sonneman & Branscombe of Spokane, who also have a lease on a mill belonging to Scales & Wagner. The Cumberland is on the opposite side of the mountain from the Poorman. It is developed by a shaft 250 feet deep and 700 feet of levels. The hoist is operated by gasoline. The ores are a gold and silver-bearing quartz, running in the ratio of one ounce gold to five ounces silver, the gold being free. The mill is being equipped with concentrators and amalgam pans, and is in charge of Stanley A. Easton.

Dewey, the midway point between Silver City and DeLamar, is the headquarters of the Florida M. & M. Co., the promotion of Col. W. H. Dewey, who erected there and equipped a fine hotel, some business buildings and an excellent 20-stamp mill. WASCOTT.

Silver City, Idaho, June 7th, '98.

The Empire at Silver City is being unwatered. It is expected that about twenty days will be required to clear the mine to the

sixth level, where development work will be prosecuted.

The Camas No. 2 mill at Hailey is running on Golden Star ore. Only ten stamps will be run for a while. If the result is satisfactory the mill will be run to its full capacity.——Most of the machinery for the Wardner M. Co.'s use on the Nabob is on the ground. As soon as the hoist is in working order there will be considerable ore taken out and some may be shipped, although the main purpose at present is to do development work on the property, which is held under bond.

The April report of Mgr. D. B. Huntley, of the De Lamar M. Co., shows: Fine gold produced at mill, $16,179.03; fine silver produced at mill, $755.86; a total of $16,934 89. Shipping ore produced, $2000; quicksilver produced in cleaning up mill, $3000; miscellaneous, $75. The total receipts were $22,009.89. The total operating expenses were $21,226.36. The profit was $783 53.

The shaft in the Standard at Wallace is down over 150 feet, and the 200-foot level will be reached early in July. The shipments of ore are gradually increasing, 450 tons a day being shipped to the concentrator. A couple of months ago the daily shipment was but 300 tons. The Standard is said to have paid $80,000 in profits last month.

The owners of the Uncle Sam will resume work in a short time. In addition to gold, the Uncle Sam carries a large per cent of silver, mostly black sulphurets, which assays $700.

Boise *Statesman*: Dr. Law is pleased with his placer property at Lardo. A ditch to carry 3000 inches of water is being constructed, and with this flow the property can be worked at a good profit for many years.

Florence *Miner*: The last samples of ore taken from the Candaleria mine gave a mill run of $35 per ton. The ledge is opened up the entire length of the claim; there are two shafts on a 4-foot wide ledge of pay ore, and 200 tons of ore are on the dumps. A milling plant will be placed on this property this summer and the mine will be systematically developed. The owner is R. J. McLean.——The Banner mine will have a capacity of about 60 tons per day; the stope at present shows 16 feet of milling ore, and the shaft is in good ore. A new stope will be started and sinking will be continued.——The new discovery on the Double Standard is improving as work continues. It is said that a hoist will be placed on the ground and active sinking begun soon.

Silver City *Avalanche*: The test run of 50 tons of Poorman ore gave results that were satisfactory to the manager. The plant is running at its fullest capacity, 10 tons daily, and is said to be saving the values very closely. The Poorman is now on the list of producers.

MONTANA.

J. H. Conrad has sold his interest in the coal and coke properties at Horr to a New York company for $780,000 cash. The property comprises the Horr coke plant and 6000 acres of coal lands. S. H. Stern, a New York attorney, came west and consummated the deal. Some of the most famous experts in the country examined the mines and reported on them before the New Yorkers decided to go into the deal. The purchasers announce that new appliances will be introduced and the plant will produce the best grade of coke.

At the Overland and Bonanza Chief near Clancy work is progressing, the large pump at the Overland, it is said, proving itself of sufficient capacity to handle the water. Extensive improvements are being made at both these mines.——The work of getting ready to operate the gold dredge at Montana City is progressing and the indications are that they will be ready to start up in a short time. At McCauley's bar, on the Prickly Pear, gold is being cleaned up monthly as usual, and along the McClellan and its tributaries work is in progress in several fair diggings.

A strike of 2½ feet of good silver ore in the Silver Chief property, which has been under development by the Hope M. Co. at Tower for a number of years, was made recently.

Secretary De Mars of the Eva May informs the Basin *Progress* that the necessary changes will soon be made in the concentrator at the mine, and everything is being put in shape to commence shipping the first-class ore to the smelters.

With the exception of the Montana Ore Purchasing Co., all the mining companies of Silver Bow county have reported their earnings for 1897 to the county assessor. The Anaconda Co. heads the list, but its production for the year is not so large as it was during 1896, there being a difference of about $360,000. The total shows a falling off of over $200,000, but the Butte & Boston, Lexington and Moulton companies report no net product for the year. The report shows the following production:

Anaconda	$4,016,350
Boston & Montana	2,882,955
Parrot	472,750
Colusa-Parrot	37 175
Alice	6,400
P. A. Largey estate	92,800
J. V. Murray	600
Total reported	$7,507,875

The Dernier claim, near Butte, has been sold by a decree of Court for $51,000. The purchaser was T. M. Hodgens of the State Savings Bank for outside parties.——Sinking is being prosecuted at the Leonard shaft of the Boston & Montana. The station at the 900 level of the West Colusa has been cut. At the Mountain View crosscutting is in progress at the 1400 level and sinking has been temporarily suspended. Sinking is also in progress at the East Gray Rock from the 1400 level. Much water has been encountered and considerable difficulty is experienced from this cause.

Weekly *Miner*: The preliminary work about the two properties of the Granite Mountain Bimetallic Co. is nearly completed. The president of the company, P. A. Fusz of St. Louis, states that the Bimetallic mill will start July 1, but that only fifty stamps will be used at first. The tramway connecting the mine and mill is in order and mining has begun. The concentrator at the mill will treat ore from the mines. It is reported that ore from the Elizabeth mine will also be handled at the mill.——The report of Mgr. W. S. Kelly of the new Elkhorn M. Co. of Jefferson county, for April, states that no prospecting was done during the month, owing to an accident to the air compressor. The amount of ore hoisted was 1608 cars, or 955 tons. At the mill eighty tons were panned, of an average assay value of 40.4 ounces. The per cent saved was 85.2. Nineteen bars, containing 27,680 ounces of silver and 17.5 ounces gold, were produced, and 150.8 tons of smelting ore ore shipped, which returned $7965. The total receipts were $23,679, and the expenses $22,-881, leaving a profit of $1298.

Helena *Independent*: In spite of the low price of silver the Moose property, of the Boston & Montana Co., have begun operations. The air compressor formerly at the Mountain View will be put in immediately, and shaft sinking will begin. The Moose has not been worked by the company since the slump in silver, although it was worked a few months by leasers, who did fairly well. With the facilities that the Boston & Montana has for treating ore, it will, it is thought, be a paying proposition.

Boulder *Sentinel*: W. H. Burgess of Helena has leased the First Shot mine, near Basin. The First Shot was discovered last fall and worked until January, when the owners stopped on account of water. A 50-foot shaft and an 80-foot crosscut have been run without finding either wall. Over $4000 worth of ore was taken from 55 feet of the crosscut. The ore runs $90 in gold, 55 per cent lead and $25 in silver, with a little copper. He will place a hoist and pump on the property within the next thirty days. The bond is for a large amount and runs eighteen months.

Livingston *Enterprise*: The first carload of machinery for the new 10-stamp mill of the Daisy M. Co. at Cooke has arrived.——The steamer J. D. Farrell, with ninety tons of ore for the smelter, was wrecked on the east shore of the canyon above Jennings, on rough boulders.——At Iron Rod over 1000 sacks of high-grade ore are being delivered for shipment to the smelter.

The *Spokesman-Review* says that news comes from Vermillion, in western Montana near the Idaho line, that the Silver Butte mine, the property of the Kentucky and Montana M. Co., has suspended operations and is tied up with liens filed by miners and millmen who have claims for wages against the property. This property has been developed under the management of R. R Schulder and J. C. Eisenmann, and the capital has come from Cincinnati and Louisville. Over $200,000 has been spent in getting the mine developed and the mill and needed buildings erected. The property was just reaching a productive stage when the entanglement came. It is said that the trouble is due to the fact that the Eastern stockholders are unduly anxious for dividends. The development of the Silver Butte consists of a tunnel 1000 feet long and a lower tunnel 400 feet. A concentrator and an electric plant have been installed. The lode is said to be 10 to 12 feet wide in a slate formation.——D. Davenport bonded for $12,000 from Dodge & Linn the Golden Dream claim near Elkhorn, and has begun the development of the property.

SOUTH DAKOTA.

Pioneer-Times: P. L. Gibbs sold the Glenwood-Sunset group in Ruby basin, consisting of thirteen claims, to a Minneapolis company, of which F. W. Johnson is Mgr. He will commence development work immediately.

There are in the neighborhood of 500 men working in the producing mines near Dumont, and 200 are working on unproductive ground, leases and prospecting.

MICHIGAN.

On June 2nd a single share of stock of the Calumet & Hecla M. Co. was sold on the Boston Exchange for $575. The company is capitalized at 100,000 shares of the par value of $25 each, making the nominal capital of the mine $2,500,000, and the actual market value $57,000,000. This is the largest market valuation ever placed upon any mine, and is equal to the market value of all the copper mines of Lake Superior less than four years ago. In the fiscal year ending April 30, 1898, the Calumet & Hecla paid dividends of $4,000,000, and in the calendar year 1897 divided $5,000,000 in profits among its shareholders.

MISSOURI.

During the five months of 1898 the Joplin district has sold 174,201,000 pounds of zinc ore and 25,028,000 pounds of lead ore, making 4527 carloads mined and sold during that time. The amount in value is represented by $2,-500,000, making an annual amount of $6,000,-000.

ONTARIO.

The Golden Star mine, near Mine Center, has enough ore on the dump to run the 10-stamp mill day and night for over a year. This rock has all been taken out in development work and none of the rich quartz has been stoped. The shaft is down 240 feet and driving deeper.

NEW MEXICO.

Silver City *Enterprise*: Every mine in operation in Grant county and vicinity has shown improvement the past six months. This is true of gold and silver mines as well as the copper mines. The Santa Rita copper mines, which a year ago were employing not over a dozen men, are now giving employment to more than 150 miners. Every miner is making big pay, leasing from the company on royalty, and before the year expires there will probably be twice as many miners employed in these mines. At Pinos Altos the Hearst people, known as the Pinos Altos G. M. Co., have about 150 miners employed in developing the gold mines of the company; the result of the development work has exceeded the expectations of the owners. When the mines are fully developed and proper reduction facilities built, the mines will give employment to at least three times as many men as at present. At Mogollon, the Confidence mine is a profitable property, and at the mill an extensive and economical water power system has been completed, insuring cheap facilities for reducing the ores.

COLORADO.

BOULDER COUNTY.

The Laramie County Tunnel Co. near Caribou has a vein 12 feet wide, with an average value of $25 ore. About 100 tons are ready for shipment.——The St. Louis is again in operation and has fifty tons of $20 ore, five tons of $60 ore, and about 2½ tons of 10-ounce ore for shipment.——The Monitor will ship from 80 to 100 tons of $20 ore for the month of June.——The Silver Point has considerable low-grade ore on the dump, which will probably be shipped for treatment.

Post: Kansas capital has purchased a two-thirds interest in the Pride of the West mine at Ward for $10,000.

In the Sweet Home tunnel, Sunshine district, in going 100 feet there have been exposed two veins. One varies from 2 to 5 feet in width and averages $30 per ton. A 3-inch streak of sylvanite and rusty gold runs from $800 to $1000 per ton. The tunnel will develop eight claims.

CHAFFEE COUNTY.

The New Year of Granite will put in a 5-stamp mill. There are now five paying mines in this section, the Belle of Granite, the New Year, the Magenta, the Robert George and the D. C. Campbell.

CLEAR CREEK COUNTY.

Leasers at the Toledo at Idaho Springs made some carload shipments of ore that averaged about $60 per ton. The first-class has not yet been moved, but it is expected to run about $125 per ton.——Seidler & Co., working in the Little Albert mine, have opened a body of smelting ore that runs three ounces gold.——The Eclipse mine has been bonded to Owen & Burns for $40,000.

The Knickerbocker tunnel is pushing ahead, and in 100 feet more will be under the Emerson shaft, from which pay ore was taken. The tunnel is in 1400 feet, 300 being on the Emerson vein, and will reach the main shaft of the Crown Point-Virginia in about 1400 feet.

EL PASO COUNTY.

Telegraph: At Cripple Creek the Lillie shipped 300 tons of ore, and has ground opened to guarantee this output and the dividend at the present rate for many months. The average of the ore is running about three ounces, although the mine produces some high-grade stuff.——J. Fitting has developed the Lafayette into a steady shipper. The second-class ore he is saving runs better than five ounces and the first grade about $500 per ton.——Potvine & Vane, leasing on the Christmas, will output this month fully 500 tons, and a fair estimate of its value will be $30,000.——The output of the Last Dollar in May was in the neighborhood of 1000 tons, 700 of which was of mill grade running at least $25 per ton. The balance was sent to the smelters and ran in carload lots from $60 to $200 per ton. The gross value of the product was not less than $40,000; the profits were fully $10,000. The shaft is over 500 feet deep.

The Moon-Anchor is producing at a heavier rate than ever in its history; it is stated that the output, which has been running at from 500 to 800 tons for months, will reach the 1000-ton mark for June.——Twenty tons of ore shipped for sampling by the Little May mine will average a little more than two ounces per ton. The rock comes from a vein between 3 and 4 feet wide.

Denver *Post*: The following list shows some of the shipments from Cripple Creek mines for one week: Work, 12 tons, average $22.80 per ton; Raven, 78 tons: Anchoria-Leland, 125 tons of smelting ore: Portland, 800 tons, the highest grade not shipped yet; Pharmacist, 62 tons of $100 ore; Lafayette, small shipments running from $100 to $500 per ton: Bankers, 75 tons running from $24 to $36 per ton: Republic, 62 tons of $40 ore; Garfield Con., about 100 tons of $100 ore and several tons of $1000 ore: Vindicator, 60 tons taken out in development work; Lillie, 300 tons; Moon-Anchor, 250 tons, of which 180 tons were smelting and 70 milling ore; the Strong, Gold Coin and Independence keep up the regular output. Six feet of $60 ore is exposed in Keith's lease on the Vindicator, from which a carload of ore is shipped every other day.——The Mattie L. is outputting ore that brings in $12,000 per month. One carload shipped in April brought $20,000.

The annual statement of the Matoa G. M. Co. of Cripple Creek shows cash receipts $182,056.27: cash on hand, $27,176.45, and no debts. The company has received as royalty from lessees $36,093.78. They own sixty and one-half acres.

GUNNISON COUNTY.

The Crystal Mountain mine, near Crystal, made a strike of copper and lead ore, which also carries silver and some gold. The tunnel in which the ore has been found is in 1300 feet and the stoping ground is extensive.

GILPIN COUNTY.

The 300 and 400-foot levels of the Gaston mine are cleaned out and ready for new contracts. Stoping ore is in sight from the 150 to the 300-foot level and it is thought the ore chute is continuous from the 100 to the 300-foot level. It is proposed to sink 100 feet deeper and connect with the 600-foot level of the Saratoga.

LAKE COUNTY.

The Bull's Eye mine near Leadville continues heavy shipments to the smelters.——It is given out by the Home M. Co. that plans are nearly completed for resuming work in the down town properties.

LA PLATA COUNTY.

The Neglected mine and mill in the Oro Fino district are demonstrating that the ores of the district, which as a rule are low grade, can be made to pay by proper treatment. Much of the ore is free, but all of it carries tellurium and makes a rich concentrate.

SAN JUAN COUNTY.

The Shenandoah, near Silverton, besides supplying the concentrating plant with twenty-two tons of second-class ore daily, is outputting thirteen tons of first-class mineral weekly, which is shipped to the smelters.——Ten tons of Bonner ore was shipped by the Abbotts, which returned 9½ ounces gold and 25 ounces silver to the ton.——Three cars of ore were shipped from the Shenandoah, Solomon mountain, the value of the product being 12-100 ounces gold, 63 ounces silver and 38 per cent lead.

In the Evening Star mine, Picayune gulch, there is a 3-foot streak of ore blocked out 80 feet high and 125 feet in length. There are two distinct classes of ore in the vein. The lead streak carries 98 ounces silver, two-thirds of an ounce gold and 20 per cent lead. The copper streak carries 88 ounces silver and 8 to 12 per cent copper.

SAN MIGUEL COUNTY.

The Butterfly mill, near Ophir station, which has been in course of construction since last November, when the Anglo-Continental G. Co. purchased the Terrible and Butterfly group of mines for $190,000, has been put in operation. The mill comprises thirty stamps with amalgamating and concentrating attachments, and has a capacity of 100 tons daily. During the summer and fall it will be operated by water power, and in the winter by electricity.——Eleven properties in the Ophir district have so far this season shipped 270 cars of mineral, about sixty-five of which were concentrates, each ton of concentrates representing from five to eight tons of crude ore.

The Japan mine in the Telluride district is working 100 men, and steadily increasing its output of concentrating ore. Every week they ship from three to four carloads of concentrates to the smelters.

ARIZONA.

The United Verde, near Jerome, has for the last eight months been shipping copper, running over 90 per cent at the rate of over 3,-000,000 pounds a month, to New Jersey. The company employs 700 men. Besides copper, the United Verde produces about $1,000,000 in gold and silver. The property pays about $4,000,000 annually over all expenses.——The Wicks & Allison Gold Bonanza, near the Fresnal, continues to produce rich gold ore. The last shipment of less than one and a half tons gave a profit of over $750 gold.——The Arizona Copper Co., at Clifton, last year treated 128,-886 tons of ore, yielding an average of $10.50 per ton. The average expenses were: Mining, $3.50; smelting, etc., $4.40; leaving a profit of $3.21 per ton.

Phœnix *Republican*: H. P. Griswold has leased the Red Cloud silver and lead property near Norton's Landing, and will at once begin taking out ore. The Red Cloud property is said to be one of the best developed mines in Yuma county, having been sunk to a depth of 600 feet, and a number of drifts run. There is a ten-stamp mill and a concentrator on the property which will be placed in action at once and soon begin the shipment of concentrates.——In Cajon canyon in the Altar district, near Cerro Colorado, the Amarillas mine is producing satisfactorily. The property is operated under bond by Gibson & Bartleson. The ledge is from 4 to 10 feet in width, and the ore is milling gold rock. There are eight shafts, from 50 to 200 feet in depth, with other development work. The mill will be started next month.——G. C. Austin has taken a lease on the Green Linnet mine Union Basin, for eighteen months. He will run a tunnel 275 feet, expecting to tap the vein at a depth of 250 feet.

Prescott *Miner*: Reports come from Lynx creek that in the shaft at 200 feet depth in the Favorite mine is a solid body of ore six feet in width of good grade.

An extensive copper strike is reported on the Montgomery lode, near Globe, by the Black Warrior Copper Co. Twenty tons are daily sent to the smelter at Globe.

Phœnix *Republican*: W. A. Rowe has bonded his Lynx creek mines, near Prescott, to Eastern capitalists.——New placer diggings are reported to have been discovered on Lynx creek. The gold is coarse.——After fifteen years of vicissitudes the Storm Cloud group of fourteen mines, near Prescott, are proving to be good producers. —— Reports come from the Favorite mine that it has a solid body of ore 6 feet in width. The shaft is 200 feet deep. The ore is of good grade.——J. Brockman, Gen. Mgr. of the Commonwealth gold mine at Pearce, paid $3500 for one-fourth interest in a group of gold claims in the Baboquivari district, Pima county. The properties are being developed.

MEXICO.

The Mexican Ore Co. at Hermosillo received from Pilares, in the Moctezuma district, a shipment of ore which ran 6000 ounces of silver to the ton.

Oasis: Wadsworth & Wilbur made a shipment of ore from the Sevillano mine, which they are working under bond and lease near Willard station. They are taking out ore which carries lead and silver.——It is credibly stated that the litigation over the mines at Lampazos, operated a long time by the Moctezuma & Cleveland M. Co. of Cleveland, Ohio, has terminated in a decree of the Supreme Court of the Republic favorable to the Cleveland company; and it is anticipated that operations will be resumed by that company upon the scale formerly prevailing. The mines are rich in silver.

Cheaper Way of Sending Circulars.

DURING the recent Miners' Convention in San Francisco it was noticed that some firms dealing in mining machinery issued circulars that were supposed to be distributed throughout the hall; but of that, probably the janitor of the hall who removed the debris could tell better. It is also noticed that some firms in San Francisco and elsewhere now and then get up circulars that they mail, mostly to men who moved from the place a year ago.

It was supposed that everybody understood what a waste of money is always involved in issuing circulars—whether distributed by hand or sent by mail; and while it is evident that those who get out circulars really want to advertise, it is equally evident that they don't know how to get at what they do want. As there appears to be a few (mostly believers in "mining directory" lists) who still think that a circular is a good thing and forget that the circulars that they send out, even when received, are always accorded the same fate that they themselves give to any circular that they receive, namely, throwing it away unread, it is deemed advisable to suggest to them a way in which they can have their circulars do them some good.

To those who have mining machinery for sale, or who want to reach the mining world, and feel disposed to cling to the ancient notion of circulars sent by mail at random to probable or possible customers, it is suggested that they can, without doing violence to their established notions, secure better results in a better way. The following tells them how it can be done, being an illustration of how to do effective circular work at a greatly reduced cost. There are very few circulars that contain more than can be prominently displayed in one page of this paper:

7,500 good circulars, well printed on fine paper, cost, say,	$ 18 75
Envelopes for same,	6 75
Addressing them,	5 50
Postage (sealed envelopes),	150 00
Total,	$181 00

Thus we find that to get 7,500 circulars into the postoffice costs $181.00. This is on the supposition that the 7,500 names to whom the circulars are addressed are those of men likely to be customers of the concern sending the circulars, which is very unlikely, as no one firm can secure a live list of possible customers that would equal in value a list containing the same number of subscribers of a good live paper that is bought and paid for and seen every week and passed around until in many cases it is worn out from the number of readers through whose hands it goes. Now, instead of spending $181.00, which is mostly thrown away, how would it do to take the same circular and put it on one page of the MINING AND SCIENTIFIC PRESS, the cost of which in place of $181.00 would be $42, or less than one-fourth of $181.00, with a hundred times the greater likelihood of value? The manufacturer or dealer in mining machinery who will spend $181.00 in an attempt to get his business before 7,500 people, could save $139.00 by putting that same circular on one page of this paper and be sure to get it before 7,500 definite, known men, thus securing a certainty instead of an uncertainty and at less than one-fourth the cost of the old way.

If a circular is so good a thing as some seem to imagine, here is a chance for them to make money and save money at the same time and to get what they want at very little cost, and in place of firing a scattering shotgun, they can shoot with a rifle and concentrate all their ammunition that way.

In figuring on the cost of these circulars it is assumed that each one is sent sealed, which involves a two-cent stamp; but even were they sent unsealed they would still cost one cent apiece for postage, which would make them cost $106.00. Herein we show how lovers of circulars can substitute certainty for uncertainty and at far less cost to themselves. The force of these remarks lies in their personal application.

San Francisco, Cal.... MINING AND SCIENTIFIC PRESS, 330 Market St.

PERSPECTIVE VIEW OF FURNACE.

PARKE & LACY CO.,

21 & 23 FREMONT ST., SAN FRANCISCO., CAL.

Mining Machinery & Supplies.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.19% sulphur, and doing excellent work; in fact it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah, one furnace; The Metallic Extraction Co., Cyanide, Colo., one furnace; The Colorado-Philadelphia Reduction Co., Colorado City, Colo., three furnaces; The Selby Smelting & Lead Co., Selby, Cal., two furnaces; The Mount Morgan Gold Mining Co., Rockhampton, Queensland, one furnace; Broken Hill Proprietary Co., Broken Hill, New South Wales, four furnaces; Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

UNION IRON WORKS,

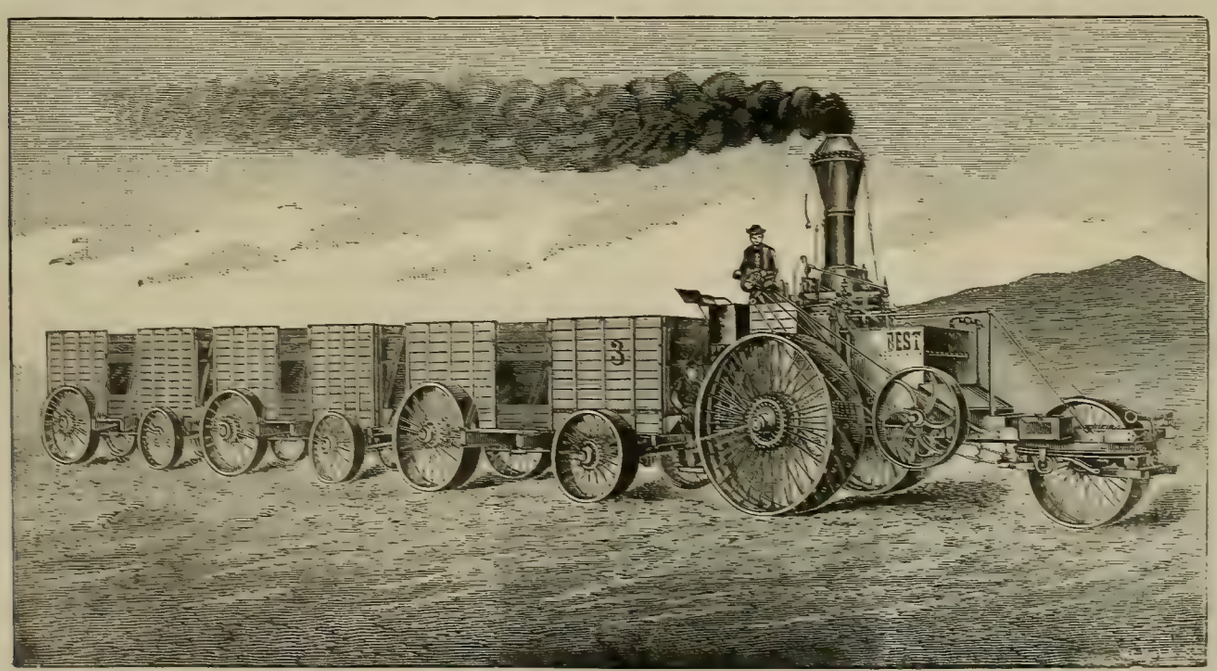
222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,



USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING: CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is be me done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 30 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads: loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build GOLD DREDGES COMPLETE IN RUNNING ORDER to handle from 100 cubic yards per hr. at a cost of 3 cents per cubic yard. We excavate 70 feet below water, 50 feet above water and handle [illegible] per day.

Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

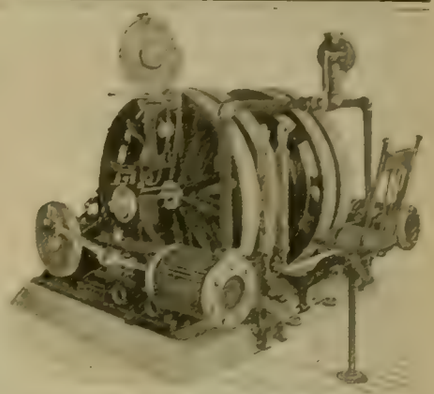
All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

"KEEP YOUR EYE ON THE INDICATOR."

Patented March 28, 1893.



The Bolthoff Automatic Signal Alarm Indicator.

HUNDREDS NOW IN USE. UNIVERSALLY RECOMMENDED.

It is without question the most accurate indicator for hoisting engines ever constructed. Not only is there no lost motion, but it has the valuable feature of a device whereby automatically the approach to station, curves in the shaft, bad places, obstructions, or, in fact, if for any reason the engineer desires to be warned of the approach of the cage or bucket to any particular point in his shaft, either in hoisting or lowering, he can set it so that the signal bell will automatically sound its alarm.

SANTA FE ROUTE

The Most Comfortable Way to Travel

ACROSS THE CONTINENT.

EVERY day in the year Pullman Palace Sleeping Cars and Pullman Tourist Sleeping Cars leave Oakland Mole for Chicago and the East.

HARVEY'S DINING ROOMS

And Lunch Counters Offer Good Food Well Cooked and Decently Served at REASONABLE PRICES.

THE altitude of the plateaus and mountains crossed renders the trip cool and pleasant after the desert is passed. No matter which way you go the desert must be crossed and there is less of it on the Santa Fe than on other lines. It is a popular mistake to suppose it is a hot line. Close connections are made in Chicago and Kansas City for all Eastern cities.

IRRIGATED LANDS OF IDAHO.

Thousands of acres of the choicest lands of the West are located along the line of THE OREGON SHORT LINE RAILROAD In Utah, Idaho and eastern Oregon. Splendid opportunities for the Investor, the Farmer and Fruit Raiser.

D. E. BURLEY, Gen'l Passenger Agent, SALT LAKE, UTAH.

THE OREGON SHORT LINE RAILROAD.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

W. J. SHOTWELL, - - - - General Agent, 314 California St., San Francisco, Cal.

S. K. HOOPER, General Passenger Agent, - - DENVER, COLO.

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid..... $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid..... $1 75

Prospector's Field Book and Guide.

By H. S. Osborn..... $1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid..... $3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.... $5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid..... $5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid..... $6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated..... $5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth..... $1 50

Quartz Operator's Handbook.

By P. M. Randall..... $2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid..... $2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather..... $5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth..... $4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth..... $5 00

Prospecting IN THE Klondike.

If it is your intention to visit the new placer field of the Klondike region, the best possible preparation you can make is to take a course of instruction by mail in

Prospecting for Gold and Placer Mining.

Established 1890. Inquire of Bradstreet's or Dun's for the standing of The Colliery Engineer Company proprietors. **Send for FREE CIRCULAR containing full particulars.**

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY
—WITH—
AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Elective system. Special advantages for men of age and experience. For catalogues address
DR. M. E. WADSWORTH, President,
Houghton, Michigan.

Reasons Why Inventors Upon This Coast Are Advised To Consult With Us:

First: Because they have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that they will get all the inventor's ideas correctly and not be liable to make mistakes.

Second: In addition to this we have resident attorneys in Washington, of long experience and high standing with the office, who attend EXCLUSIVELY to our business before the Patent Office. You have, therefore, the advantage of personal consultation in the preparation of the case, and constant attention to your application after it has been filed.

Third: Time is saved. If you send to an Eastern attorney you must depend upon your ability to write a perfect explanation to a person three thousand miles away, wait until the papers can be returned to you for signature, and then send them again to your agent to be filed, if they are fortunate enough not to need further revision and return.

Experience in preparing patent applications here and in the East has proved to us that superior work can be done here.

We have been credited with obtaining more patents in proportion to the number of applications made by us than any other firm in the business.

We have had a continuous experience in this business of over thirty years. We have the most complete Patent Library west of the Mississippi river, including full certified copies of all patents issued for the past twenty-five years. We keep these for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches and opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete.

DEWEY, STRONG & CO.,

Market Reports.

The Markets.

SAN FRANCISCO, June 23, 1898.

SILVER.—London, 27⅛d; New York, 58⅞; San Francisco, 59; nominal.

COPPER.—Lake, 11¾ and 12. For the five months ended May 31, 1898, the production of the metal in the United States aggregated 101,000 tons—34,000 tons more than was produced in the same time in 1895. Of this increase 33,000 tons more were shipped abroad this year than in 1895, the exports being 58,000 tons in 1898, against 25,000 tons in 1895. Thus, while the domestic consumption of the metal has practically stood still during the past four years, the foreign markets have taken our surplus production.

LEAD.—New York quotes 4.02½ asked; local, pipe, 5¼, 6; sheet, 6¼ and 7.

IRON.—American, soft, $20 and $22 per ton.

SPELTER.—5 and 5¼.

TIN.—Plate, American, $3.50; English, to arrive, $4.25; Pig 16c.

ANTIMONY.—9½, 10.

NAILS.—List per keg: No. 20 to 60d, wire, $2.25; cut, $2.10; 10 to 20d, wire, $2.30; cut, $2.15; 8d, wire, $2.35; cut, $2.20; 6 and 7d, wire, $2.45; cut, $2.30; 4 and 5d, wire, $2.55; cut, $2.40; 3d, wire, $2.70; cut, $2.55; 2d, wire, $2.95; cut, $2.80. In carload lots, 10c per keg less.

QUICKSILVER.—Firm and quiet; domestic, $42.50; export, $38.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$10 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd.	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 60

CHEMICALS.—Cyanide of potassium is quoted jobbing, 33@33¾c per lb.; carloads, 29½c; sulphuric acid, 2c per lb. for 60%; nitric acid, 7½c in carboys; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 4¼c per lb.

LUMBER.—Retail: Pine, ordinary sizes, $17@18.50; redwood, No. 1, $18@20; No. 2, $16@18.

Mining Share Market.

SAN FRANCISCO, June 23, 1898.

At present prices the entire Comstock is worth less than $500,000; time was when it was selling for $500,000,000. It is understood that there is to be a further reduction both on the street and in the mines, should both continue to be worked. Con. Cal. & Va., according to unverified statement, proposes two 10-hour shifts at $4, instead of three 8-hour. In executive session this morning, the San Francisco Stock & Exchange Board reduced the monthly salary of the chairman from $150 to $5, whereupon the incumbent resigned. The position will be filled in turn by the members. The same Board refused to consider Comstock drainage and deep mining. Unless some move in that direction is soon made, the Board may lack excuse for existence.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Commercial Paragraphs.

DIVIDEND No. 28 of 25 cents per share on the capital stock of the Paraffine Paint Co. is payable on the 29th inst.

THE bid of Mr. Frank Brown of the Washburn-Moen Co., 8 and 10 Pine street, San Francisco, of $1877.88 for the wire necessary for the lighting of the new union ferry depot at the foot of Market street, San Francisco, has been accepted by the State Board of Harbor Commissioners.

THE Jeanesville Iron Works Co. of Denver, Colo., has furnished the Daniels & Fisher Dry Goods Co. of that city a 1200-gallon compound elevator pump, which is in operation. Mr. Middlebrook, the Denver agent for the Jeanesville Iron Works Co., writes that "it is the finest finished and smoothest running pump in Denver."

UNDER date of May 21, Ambassador Hitchcock writes from St. Petersburg to the State Department: "I am pleased to report that the Imperial Government has awarded the Westinghouse Co. a contract amounting to between $2,000,000 and $3,000,000 for the equipment of the rolling stock of its railways with Westinghouse air-brakes, and that this contract will probably be duplicated in the near future."

Assessment Notices.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1898, an assessment (No. 19) of three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidsdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 3d day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidsdorff street, San Francisco, Cal.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of June, 1898, an assessment (No. 12) of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 29, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 22nd day of July, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 12th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, 309 Montgomery street, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.

R. L. CHENEY, Secretary.

Office—Room 7, fifth floor, Mills building, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of June, 1898, an assessment (No. 10) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of July, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 8th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

To Obtain Thorough and Economical Lubrication,

LUNKENHEIMER'S

"SENIOR" (double connection) and

"JUNIOR" (single connection)

SIGHT FEED LUBRICATORS

Will fill the bill. They satisfy the most exacting. Made in standard sizes.

Specify "Lunkenheimer" make and get the best. Supplied by dealers everywhere.

Our catalogue of modern high-grade brass and iron steam specialties gratis.

CONS. ST. GOTHARD GOLD MINING COMPANY. Location of principal place of business San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of June, 1898, an assessment (No. 14) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1898 will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 10th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, San Francisco, Cal.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap District, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 27th day of April, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M. Binckley	2	1	2 00
Alice E. Binckley	20	4	8 00
Alice E. Binckley	23	20	40 00
Alice E. Binckley	24	20	40 00
Alice E. Binckley	25	20	40 00
Alice E. Binckley	26	20	40 00
Alice E. Binckley	39	1	2 00
Alice E. Binckley	40	2	4 00
Caroline S. Townsend	18	20	40 00

And in accordance with law, and an order from the Board of Directors, made on the 27th day of April, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 125 Beale St., San Francisco, California, on MONDAY, the 27th day of June, 1898, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale St., San Francisco, California.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Assaying Gold

.....AND.....

Silver Ores.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

Shasta Co., Cal. Mines, 10, 38, 58, 86, 162, 182, 209, 233, 262, 289, 321, 345, 373, 397, 422, 445, 469, 493, 517, 541, 561, 569, 586, 593, 621, 645, 670.
Shaft Begun from the Bottom....155
Sinking in the Witwatersrand....419
Ship Displacement of....4, 372
Siberian Mines....87, 157, 212, 589
Railway....104, 287
Coast Trade....572
Sierra Co., Cal., Mines, 10, 38, 58, 86, 162, 182, 209, 233, 262, 289, 321, 373, 397, 422, 469, 517, 569, 593, 621, 645, 671.
Sierra Nevada, Gold Deposits....258
Sierra Buttes G. M. Co....512
*Signaling Through Space Without Wires....36
Silver, Test for....468
Silver, Fusing Point of....515
*Silverton, Colorado....237
Silver Product of California, '97....97, 563
Cost of....1
Exports for February, '98....378
Exports from New York for '97....85
Exports from U. S. '97....104, 621, 642
Single vs. Multiple Cylinder Engines....232
Siskiyou Co., Cal., Mines, 10, 38, 58, 86, 162, 182, 209, 233, 262, 289, 321, 345, 373, 397, 422, 445, 469, 493, 517, 541, 569, 593, 670.
*Site of Marshall's Gold Discovery in California, 112, 113.
Slate Product of California, '97....563
Slimes, Treatment of....391, 416, 441, 465, 490
Process, Bettel's....34, 396
Slimes, Use of Lime in Cleaning....513
*Smelting in Colorado....286
Trust....154
*Plant at Anaconda, Montana....77
Soda Product of Cal., '97....563
South Africa Mines....88, 111, 212, 261
Mining Enterprises....537
Gold Yield for '97....104
*South Paloma, Cal., Mines....3
Solvent Powers of Cyanogen....56
Sonora Folio Geologic Atlas....638
South Dakota Mines, 40, 87, 163, 183, 234, 264, 290, 321, 346, 374, 398, 424, 446, 470, 494, 518, 542, 570, 595, 623, 646, 672.
Speed Government in Water Power Plants. 513, 540, 565, 589, 616.
Spelter, Production of in U. S....207
Spanish Mines....88
Spanish Mine, Nevada Co., Cal....154
*Spenceville, Cal., Copper Mines....509
Stamps vs. Rollers....640
Stamps, Water Required for....511
*Stamp Mills, Proposed Changes Therein, 228, 414, 467.
Stamp Milling of Gold Ores, Relative to Cyaniding....160, 318
*Guide....316
